# Washington State Economic and Revenue Forecast

Prepared by the Economic and Revenue Forecast Council

September 2014 Volume XXXVII, No. 3

### **Preface**

#### **ERFC** forecasting structure and schedule

The Economic and Revenue Forecast Council is required by Chapter 231, Section 34, Laws of 1992 (RCW 82.33.020) to prepare a quarterly state economic and revenue forecast and submit it to the Forecast Council. This report presents the state's economic and General Fund-State revenue forecast. It is issued four times a year. The Washington State GF-S revenue forecast is prepared quarterly in conjunction with the state economic forecast for the Economic and Revenue Forecast Council. The Council consists of six members, two appointed by the Governor and four appointed by the Legislature - one from each caucus of the Senate and House of Representatives. Current members of the Economic and Revenue Forecast Council are listed inside the front cover of this publication. The GF-S revenue forecast is updated four times per year: March (February in even-numbered years), June, September, and November. The staff of the Economic and Revenue Forecast Council is responsible for the preparation of the state's economic forecast and the forecast of the Department of Revenue's GF-S revenue sources as well as GF-S revenue from fines and forfeitures collected by the Administrative Office of the Courts. The staff is also responsible for review and coordination of the revenue forecasts of other agencies that collect relatively large amounts of GF-S revenue. These are the Department of Licensing, the Office of the Insurance Commissioner, the Lottery Commission, the State Treasurer, the Liquor Control Board and the Office of Financial Management. The Office of Financial Management is responsible for summarizing the forecasts of all other state agencies that collect relatively smaller amounts of GF-S revenue.

#### **Forecast Procedure**

For each quarterly update, the staff of the Economic and Revenue Forecast Council, under the direction of the Executive Director, reviews (and if warranted, modifies) a national economic forecast prepared by Global Insight, Inc. A state economic forecast is then prepared using an econometric model that links Washington's economy to the national economy. After review by forecast workgroups; the Governor's Council of Economic Advisors; and the Economic and Revenue Forecast Council in public; this state economic forecast (updated for newly released data) is used to prepare a baseline revenue forecast for GF-S and the related funds. The forecasts are based on current law and administrative practices and do not reflect pending legal challenges to GF-S receipts until they are resolved. Additionally, at least two alternative forecasts are prepared for all GF-S and related fund sources and presented to the Forecast Council for approval. Once the Council approves the forecast, it becomes the official forecast of GF-S and related fund revenues.

Data in this publication are accurate through September 30, 2014

September 2014 iii

- The national economy continues to advance at a moderate pace. Uncertainty remains elevated and downside risks once again outweigh upside risks.
- U.S. real GDP rebounded sharply from its winter slump, increasing 4.2% (SAAR) in the second quarter from a 2.1% (SAAR) decline in the first quarter.
- Federal fiscal policy remains a drag on economic growth through contractionary spending and tax policies. Monetary policy remains accommodative, but rate increases are expected next year.
- Weak growth in Europe and slowing Asian growth remain significant threats to the U.S. economy.
- The Blue Chip Consensus GDP forecast, now calls for real GDP growth of 2.1% in 2014, down from 2.2% in the previous forecast. Real GDP growth is expected to increase to 3.0% in 2015, then slowly trend down to 2.5% in 2019.
- As expected in the June forecast, the Washington economy continues to expand at a moderate pace.
- Washington employment growth has been stronger than expected in June and historical estimates were revised higher.
- Overall housing construction is on track but single-family permits are weak.
   Seattle home prices have declined in two of the last three months.
- Since the recession, Washington consumer spending growth has been positive but weak.
- Revenue collections since June have come in \$115 million over the forecasted amount, but much of the variance was due to non-economic events.
- Changes to the economic forecast and taxable activity since the June forecast were small and mixed but the net result was slightly positive. They resulted in increases in expected revenue of less than one percent for each of the forecasted biennia.
- The forecast of General Fund-State (GF-S) revenue for the 2013-15 biennium was increased by \$163 million and the forecast for the 2015-17 biennium was increased by \$143 million. The forecast for the 2017-19 biennium was increased by \$164 million.
- The Boom Monitor Index (BMI) is a coincident index which measures the sustainability of Washington growth while also providing insight to upside and downside risks. This latest revision comprises several component changes and a reweighting of the index, improving current and historical accuracy.

#### **U.S. Economic Forecast**

The moderate economic recovery has continued

The national economy continues to advance at a moderate pace. Growth in gross domestic product (GDP) rebounded in the second quarter at a rate of 4.2% after contracting 2.1% in the first quarter. Significant threats to the economic recovery remain, keeping uncertainty elevated. Violence in the Middle East, declining housing affordability, and reduced economic growth overseas all threaten to derail the recovery. Overall, economic activity has generally been in line with the June baseline forecast of moderate growth and slowly declining unemployment. Despite a slowdown in hiring in August, recent data suggest that the economy's underlying fundamentals remain firm.

Federal fiscal policy remains a drag on the recovery, while monetary policy is accommodative

Federal fiscal policy remains a drag on economic growth through contractionary spending. Real federal government expenditures were down 0.9% (SAAR) in the second quarter and have declined in each of the past seven quarters. In 2013, reductions in federal government spending are estimated to have reduced overall GDP growth by 0.5 percentage points. Monetary policy remains accommodative, although the Federal Reserve is now wrapping up its unconventional policies. Although the bond buying will come to an end, the Federal Reserve remains committed to keeping the fed funds rate low for a "considerable time." An increasing number of Fed officials are wondering if there is much else monetary policy can do to bolster the economy.

The European and Chinese economies are weak The European economy remains stagnant and has yet to officially emerge from the recession that started at the end of 2011. The combination of the current European recession with the 2007-09 recession has resulted in a historic period of economic weakness. Real GDP in the Eurozone is still lower than in 2008. Economic activity in China has continued to weaken. In response to the weak growth, the Chinese government introduced a variety of small-scale stimulus measures. China has struggled to transition to a more consumer based economy and lower its reliance on exports. Concerns about a credit bubble, housing glut, and excess capacity in many industrial sectors had restrained the government from launching more aggressive stimulus programs. Weak economic growth in Europe and China will continue to threaten the U.S. recovery due to international trade ties.

#### **Washington Economic Forecast**

The Washington economy continues to show moderate growth

In recent months the Washington economy has performed slightly better than expected in the June forecast. The current level of employment is higher than anticipated in June both because growth has been stronger than expected and because historical estimates have been revised up. As anticipated, Washington personal income growth was weak in the second

quarter, largely due to aerospace bonuses paid in the first quarter which were not repeated in the second quarter. Single-family housing construction was once again weaker than expected in the second quarter of 2014 but overall construction was close to the forecast thanks to strong multi-family construction. Seattle area inflation is about the same as the national rate. Shelter costs are rising faster than elsewhere in the U.S. but other prices are rising more slowly.

The September Washington forecast reflects a very similar U.S. forecast The September Washington State forecast is based on a new national forecast that is very similar to the forecast adopted in June. While real GDP is lower in the new forecast, the reason is a downward revision in historical estimates resulting from the annual revision of the national income and product accounts (NIPAs). GDP growth in the forecast averages 2.7% per year through 2019, the same rate as in the June forecast. Employment growth averages 1.4% per year, real personal income growth averages 3.3% per year and PCE inflation averages 1.5% per year, all the same as in June. Oil prices, however, are lower than assumed in June in the near-term but also decline less. These minimal revisions in the national forecast feed through to the state economic forecast.

Washington will continue to outperform the U.S. in growth Our September 2014 forecast of Washington employment is higher than assumed in June due mainly to stronger than expected growth through August. Employment growth for the remainder of the forecast is also slightly higher than in the June forecast. Our current estimate of Washington personal income growth in the first half of 2014 is also higher than anticipated in the June forecast, resulting in a stronger forecast for 2014. Our new forecast for nominal personal income growth from 2015 through 2019 is also slightly higher than the rate predicted in June. The number of housing units authorized by building permits was close to the forecast in the second guarter of 2014. Once again the multi-family segment was stronger than expected but single family construction was weaker. As a result, we have slightly lowered our single-family housing permit forecast and raised our multi-family forecast. Our September economic forecast for total Washington housing units is very similar to the forecast adopted in June.

#### **Revenue Forecast**

Changes to the revenue forecast in September were once again slight but positive Revenue collections since the June 2014 forecast came in \$115 million higher than the expected total. Most of the surplus came from Revenue Act taxes (retail sales and use, business and occupation, public utility and tobacco products taxes), which came in \$106 million above the forecast. While preliminary data indicate that second quarter economic activity was slightly higher than forecasted, much of the extra revenue was the result of lower-than-expected refunds and redemptions of tax credits rather than increased activity. As the reduced level of refunds

and tax credits is not expected to continue, and changes to the economic forecast were slight, total forecasted revenue for the biennium has been increased by only \$47 million above the current collection variance. Forecasted collections for the 2015-17 and 2017-19 biennia have been increased by similar amounts. As was the case in June, forecast increases amounted to less than one percent for each of the forecasted biennia.

GF-S forecast change by biennium (millions):

13-15: +\$163 15-17: +\$143 17-19: +\$164 As of September 10<sup>th</sup>, revenue collections for the 2013-15 biennium were \$115.1 million ahead of the June forecast. For the remainder of the biennium, changes to the economic forecast have increased forecasted revenue by \$47.4 million. The sum of these changes for the 2013-15 biennium is a forecast increase of \$162.5 million, with total biennial revenue of \$33,331.9 million. The forecast for the 2015-17 biennium has been increased by \$143.0 million and the forecast for the 2017-19 biennium has been increased by \$164.2 million. GF-S revenue is now forecasted to total \$36,078.2 million in the 2015-17 biennium and \$39,187.6 million in the 2017-19 biennium.

#### **Washington Boom Monitor Index**

The national BMI measured sustainability of growth

The original Boom Monitor Index (BMI) was designed and constructed by Data Resources, Inc. At its inception the original BMI measured the sustainability of growth rates in the national economy. To construct the composite index, each of the eight series is first regressed against time in order to correct for any historical upward or downward trends. Then, the series are adjusted so they have an average value of 50 and a standard deviation of 20. These indexed values are then weighted according to their standard errors in regressions against the U.S. Department of Commerce's Index of Coincident Indicators. The BMI Composite has a historical average of 50 and a standard deviation of 20, just like the component series. Any reading more than one standard deviation away from the average (above 70) indicates growth rates that are only temporarily sustainable.

The WA BMI is similar to the original national index

The original Washington BMI is constructed in the same fashion as DRI's national BMI. After its inception in the June 1990, the Washington Boom Monitor Index underwent its first revision in March 1999. After the 1999 revision, Washington's Boom Monitor Index was not revised until September 2014, except for annual reweighting. The BMI underwent a large number of changes with the goal of smoothing out the volatile month-to-month readings of the old index, updating components to take into account the most recent housing bubble and subsequent collapse, and to reweight the index for a more accurate picture of the sustainability of Washington's economic growth. The Boom Monitor gives forecasters a glimpse into growth rate sustainability and provides useful information for making upside and downside risk probability adjustments.

#### Chapter 1: U.S. Economy - Current Conditions and Forecast

- The national economy continues to advance at a moderate pace. Uncertainty remains elevated and downside risks once again outweigh upside risks.
- U.S. real GDP rebounded sharply from its winter slump, increasing 4.2% (SAAR) in the second quarter from a 2.1% (SAAR) decline in the first quarter.
- Although total nonfarm payroll employment growth was disappointing in August, it remains sufficient to absorb new entrants into the labor market and reduce unemployment.
- The modest housing market recovery has continued. Home prices are no longer increasing, although the pause in appreciation is expected to be temporary. Homebuilders are optimistic, but this has not yet led to a rebound in activity.
- Federal fiscal policy remains a drag on economic growth through contractionary spending and tax policies. Monetary policy remains accommodative, but rate increases are expected next year.
- Weak growth in Europe and slowing Asian growth remain significant threats to the U.S. economy.
- The Blue Chip Consensus GDP forecast, now calls for real GDP growth of 2.1% in 2014, down from 2.2% in the previous forecast. Real GDP growth is expected to increase to 3.0% in 2015, then slowly trend down to 2.5% in 2019.
- A more robust recovery in housing remains the most significant upside risk. A slowdown in Chinese or European growth is the major downside risk.

#### **Current Conditions**

The moderate economic recovery has continued

The national economy continues to advance at a moderate pace. Growth in gross domestic product (GDP) rebounded in the second quarter at a rate of 4.2% after contracting 2.1% in the first quarter. Significant threats to the economic recovery remain, keeping uncertainty elevated. Violence in the Middle East, declining housing affordability, and reduced economic growth overseas all threaten to derail the recovery. Overall, economic activity has generally been in line with the June baseline forecast of moderate growth and slowly declining unemployment. Despite a slowdown in hiring in August, recent

data suggest that the economy's underlying fundamentals remain firm.

U.S. real GDP rebounded in the second quarter

U.S. real GDP rebounded sharply from its winter slump, increasing 4.2% (SAAR) in the second guarter from a 2.1% (SAAR) decline in the first quarter. Consumer spending made the largest contribution to growth, increasing 2.5% (SAAR) and adding 1.7 percentage points to overall GDP. Inventory investment was also a major source of growth, contributing 1.4 percentage points in the second quarter. This will be a negative to growth going forward. Fixed investment was strong as well, with gains in both the nonresidential and residential sectors. Nonresidential fixed investment increased 8.4% (SAAR) in the second guarter while residential fixed investment grew 7.2% (SAAR). Together, total fixed investment added 1.3 percentage points to second quarter GDP growth. Exports growth was strong as well, although this was more than offset by an increase in imports. Government expenditures turned positive, adding 0.3 percentage points to growth, fueled by state and local government spending. Real final sales, which exclude inventories, grew 2.8% (SAAR) in the second quarter, up from a 1.0% (SAAR) decline in the first quarter.

Personal income is rising, but real wage growth remains weak

Rising personal income is essential for consumer spending to improve and overall economic growth to accelerate. Real personal income was up 0.3% in August, up from 0.2% the month before. Real disposable personal income (income after taxes and adjusted for inflation) growth was 0.3% as well. While real personal income has continued to increase, real wages have been flat (see Figure 1.1). Recent income gains have been led by increases in proprietors' income, rental income, and income from dividends. With weak real wage growth, spending growth has

Figure 1.1: Year-Over-Year Growth in U.S. Real Hourly Wages

Real wage growth has been almost nonexistent this recovery

Source: U.S. Bureau of Labor Statistics; data through August 2014

been inconsistent. Consumption growth rose 0.5% in August after no gain the month before. The personal saving rate declined from 5.6% to 5.4%. Spending on durable goods was up 1.8% after no increase the month before. New vehicle sales have been strong, surging to 17.5 million units (SAAR) in August, a post recession high. Nondurable goods spending was down 0.2%. Consumption of services increased 0.5% even with weak healthcare spending.

Employment growth was disappointing in August Employment growth in August was disappointing, with the economy creating only 142,000 jobs. Prior to August, employment growth had been over 200,000 jobs each month for the past six months. Retail trade was particularly weak in August, contracting by 8,000 jobs after a 21,000 job gain in July. Manufacturing was weak as well in August, adding no jobs after increasing 28,000 the month before. On the positive side, construction added another 20,000 jobs, professional and business services was up 47,000 jobs, and healthcare grew by 43,000. Even with the overall weakness in jobs in August, the labor market remains solid. There is difficulty accurately capturing the seasonal variation in August jobs data and the numbers typically get revised up by large amounts. Even with the weak report, the three month moving average of job growth is 207,000, sufficient to reduce unemployment.

The labor market is improving

The recent level of job growth is absorbing not only unemployed workers, but some new entrants into the labor force as well. The unemployment rate dropped to 6.1% in August and remains on a downward trend. Although the labor force declined in August by 64,000, the recent trend has been positive. Also, previously discouraged workers are coming off the sidelines and re-entering the labor force now that they believe they have a chance at employment. Joblessness, while still elevated at 9.6 million people, has dropped by a third since the recovery began. The most comprehensive measure of underemployment, which includes those marginally attached to the labor force plus workers employed part time for economic reasons, has declined from 16.5% to 12.0% since the start of the recovery. Initial claims for unemployment insurance remain on a downward trend and are now back to pre-recession levels. For the week ending September 20<sup>th</sup>, the four week moving average of initial claims dropped by 1,250. The latest reading is down 5,9% from a year ago and down 54.7% since the peak in 2009.

Consumer confidence continues to trend upward

Consumer confidence has been increasing recently, but has yet to break out to levels typically seen at this point in a recovery. An improving economy and stronger labor market conditions have enabled consumers to feel more confident as the recovery has unfolded. Rising home prices and equity markets have also improved consumer's financial position. The most recent reading of consumer confidence from the Conference Board shows that confidence took a big step back in September, dropping 7.4

points. Both the present conditions and expectations components fell. Although this is an unusually large decrease, it represents more of correction from the large increases in July and August. Consumer confidence remains near a post recession high excluding the last two months. The University of Michigan reading of consumer sentiment showed a 2.1 point increase in September, reaching a 14 month high. Consumers indicated they were more optimistic about the economic outlook. This was slightly offset by a reduction in attitudes about current conditions. Both measures should continue to trend upward as the economic recovery continues.

Small business confidence is improving Small business confidence has been increasing as well. The National Federation of Independent Business (NFIB) small business optimism index increased 0.4 points in August to 96.1. The improvement in optimism was broad based. Fewer small companies are facing declining revenues and a majority indicated they believe sales will improve in the near future. Also, more respondents indicated they are less threatened by an external shock to the U.S. economy from abroad. Hiring and compensation plans remain solid. No longer are poor sales or other economic factors the largest problems for small businesses. As the recovery solidified and demand increased, taxes and government regulation have reemerged as the most concerning problems cited by small businesses.

Oil prices are declining despite the turmoil in the Middle East

Oil prices have continued to drop after peaking in June. Even with the conflict in the Middle East intensifying, energy markets have been able to digest the turmoil. Disruptions related to the unrest have been viewed as temporary and are no longer causing large price swings. Brent oil prices have come down \$20 to \$95 per barrel in the past few months. West Texas crude is down to \$91 per barrel after hitting \$108 per barrel in the third week of June. Although Islamic militants have expanded their grip in North and Western Iraq, their actions have had very little impact on the country's production and exports since major oil operations are in the south. In addition to the turmoil in Iraq. Russia's intervention into Ukraine has the potential to rattle oil markets in the near term, as Russia is one of the world's biggest oil producers. U.S. oil production has continued to rise, making up the lost supply from Middle Eastern countries. Domestic production now averages over 8 million barrels per day, the highest in decades.

Inflation remains low

Headline inflation fell in August for the first time in over a year. The overall index dropped 0.2% led by a drop in the energy index which declined 2.6%. Gasoline prices fell sharply and natural gas and fuel oil indexes were also down. Electricity prices were up slightly. Overall, energy prices are now up just 0.3% from a year ago. Food prices moved up, increasing another 0.2% in August, and are now up 2.7% year over year. Shelter costs increased 0.2% and are now up 2.9% year over year. Overall,

the consumer price index (CPI) is now up 1.7% over the year. Core inflation, which excludes food and energy was flat in August and is also up 1.7% since last year.

The modest housing recovery has continued

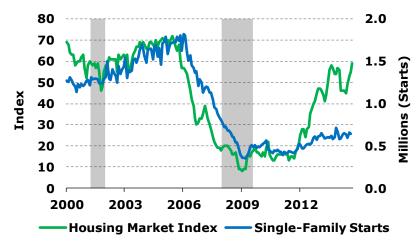

The housing market recovery has continued after struggling to gain traction early in the year. Recent data have generally been positive and indicate that activity is set to accelerate. Sales of new homes soared in August to 504,000 units (SAAR), an increase of 18.0% over July and 33.0% higher than a year ago. Despite the increase, the inventory of unsold homes edged up 4,000 to 206,000. This inventory corresponds to a 4.8 months' supply of new homes at the current sales pace. Mortgage rates reached their lowest level of the year in August, spurring potential buyers to take advantage of the reduced payments. Sales of existing homes, which is a much larger segment than new homes, fell slightly this past month. Completed sales in August fell 1.8% from July to 5.05 million units (SAAR). Sales are still 5.3% lower than a year ago. The decline was in both single family (-1.8%) and condo and co-op sales (-1.7%). The market for existing homes remains tight compared to last year, but has loosened somewhat in recent months. Total inventory increased to 2.31 million homes, up 4.5 percent from a year ago and representing a 4.8 month supply.

New construction has been modest despite homebuilders' optimism

Home construction remains modest and well below levels seen before the recession. Housing starts slowed in August to 956,000 units (SAAR) after coming in at 1.1 million units (SAAR) in July. Even with the slowdown from the prior month, housing starts are 8.0% higher than a year ago. Much of the drop was a reversal of last month's spike in multi-family housing, which declined 31.7% in August after a 44.9% jump in July. Single-family housing declined 2.4% in August. Housing permits showed a similar pattern as starts. Total permits declined 5.1% in August after a strong 8.6% increase in July. Similar to starts, multi-family housing reversed its previous month's gains and declined sharply while permits for single-family homes fell slightly. Both housing starts and permits are hovering around the 1.0 million unit (SAAR) range, a level which would be considered weak prior to the recession. While housing activity remains sluggish, homebuilder confidence continues to improve (see Figure 1.2). The NAHB housing market index, which measures confidence in homebuilders, indicates that homebuilders are incredibly optimistic. In August, the composite index was 59, the highest since November 2005 and well above the average of 48 since its inception in 1985. Although the surge in confidence has not yet translated into a surge in activity, it is pointing to some upside risk to the housing market. However, while pent-up demand is contributing to the optimism, first-time homebuyers are not entering into the market. According to the NAHB, this is partly due to the fact that incomes for those in the first-time buyers demographic have not kept up with the rise in prices as the recovery has taken hold.

Figure 1.2: Homebuilder Confidence and Single-Family Housing Starts

Home construction has not kept up with confidence

Source: NAHB/Wells Fargo, U.S. Census; data through September 2014

Home prices are no longer increasing

Home price appreciation is starting to decelerate and even turn negative. The seasonally adjusted Case-Shiller 20-city home price index decreased 0.2% in June, the second consecutive month of decline after increasing in each of the previous 27 months. Even with the decline, however, prices are still 8.1% higher than the previous year. Although prices have increased 21.2% since the trough of the recession, they remain 17.4% below their previous peak. The rise in home prices has been positive for the overall housing market. Rising prices have typically incentivized new construction and are enabling previously underwater homeowners to sell their homes and trade up for more expensive houses. Affordability issues are starting to emerge however, especially among first time home buyers as prices increase. Although homes remain affordable by historic standards, affordability is down sharply from the past two years.

The manufacturing sector continues to improve

The manufacturing sector continues to improve. The Institute of Supply Management (ISM) Report on Business indicated that activity in the manufacturing sector expanded again in August. The ISM index improved to 59.0 from 57.1 the month before (index levels above 50 indicate expansion). Details from the report were generally positive. New orders increased 3.3 points to 66.7 and production rose 3.3 points as well to 64.5. The employment component fell 0.1 points but remains positive at 58.1. The latest G-17 report from the Federal Reserve, which measures manufacturing output, indicated a slight contraction in August. Output declined 0.4% (SA) in August although it remains 3.6% above last year. The production of durable goods declined 4.4% primarily due to a 7.7% drop in automotive products. Nondurable goods output increased, gaining 0.3%. New orders for core capital goods (nondefense capital goods excluding aircraft) increased by 0.6%, after declining 0.2% in July.

Shipments increased 0.1%, indicating positive near-term business activity.

Federal fiscal policy remains a drag on the recovery

Although uncertainty surrounding federal fiscal policy has receded, it still remains a drag on economic growth through contractionary spending. Real federal government expenditures were down 0.9% (SAAR) in the second quarter and have declined in each of the past seven quarters. In 2013, reductions in federal government spending are estimated to have reduced overall GDP growth by 0.5 percentage points. State and local government spending, however, has started to increase. Due to improving tax revenues, state and local governments are no longer slashing spending to balance budgets. State and local government spending increased 3.4% (SAAR) in the second quarter, and has had positive growth in five of the past six quarters.

Monetary policy will likely remain accommodative in the short term Monetary policy remains accommodative, although the Federal Reserve is now wrapping up its unconventional policies. In September, the Fed reduced its quantitative easing (QE) program by another \$10 billion. They remain on track to announce the final reduction of QE next month. Although the bond buying will come to an end, the Federal Reserve remains committed to keeping the fed funds rate low for a "considerable time." Most Fed members would like to raise interest rates in 2015. However, there remains some disagreement about whether inflation will remain below the 2% target and how much strength is in the labor market. An increasing number of Fed officials are wondering if there is much else monetary policy can do to bolster the economy.

Weakness in European economies remains a significant threat to the recovery The European economy remains stagnant and has yet to officially emerge from the recession that started at the end of 2011. The combination of the current European recession with the 2007-09 recession has resulted in a historic period of economic weakness. Real GDP in the Eurozone is still lower than in 2008. The prolonged slump is now comparable to the point Europe was at six years after the Great Depression (see Figure 1.3). Although the Eurozone economy is no longer contracting, growth remains anemic. Real GDP in the Eurozone increased at a 0.1% annualized rate in the second quarter of 2014, down from a 0.9% rate the previous quarter. The weakness in European economies remains a threat to the U.S. economic recovery. Risks of a financial crisis remain and weak growth abroad limits U.S. export potential. Some member countries continue to experience negative growth, including France and Italy. Job gains in the Euro area have been weak and unemployment elevated. Consumer confidence in the Eurozone dropped in September for the fourth consecutive month. Poor economic conditions across the European Union will continue to put financial pressure on member countries and keep the threat of a European financial crisis alive.

Figure 1.3: Eurozone GDP

The Eurozone has experienced years of stagnation

Source: Eurostat, Angus Maddison, Blue Chip; data through 2014

Slower growth in China remains a risk to the recovery Economic activity in China has continued to weaken, threatening the U.S. recovery through international trade ties. Chinese GDP growth inched up to 7.5% (Y-O-Y) in the second quarter from 7.4% in the first quarter. For China, growth below 8% is considered poor. The last time Chinese growth was above 8% was the first quarter of 2012. In response to the weak growth, the Chinese government introduced a variety of small-scale stimulus measures. China has struggled to transition to a more consumer based economy and lower its reliance on exports. Concerns about a credit bubble, housing glut, and excess capacity in many industrial sectors had restrained the government from launching more aggressive stimulus programs. Improvement in the U.S. and Eurozone economies should help China's exports rebound moderately, although it will be insufficient to offset the weakness in investment demand.

#### **Forecast**

Our forecast is based on the latest Blue Chip Consensus forecast The September 2014 economic forecast was based on a modified version of Global Insight's September 2014 Control forecast for the U.S. economy. Consistent with our standard practice, the U.S. real GDP forecast was adjusted to match the Blue Chip Consensus GDP forecasts for 2014 and 2015. We also incorporated the latest long term Blue Chip GDP forecast for 2016 through 2019. Our oil price forecast was adjusted to incorporate futures prices for both Brent crude oil and for West Texas Intermediate crude.

Real GDP growth is down slightly from the previous forecast

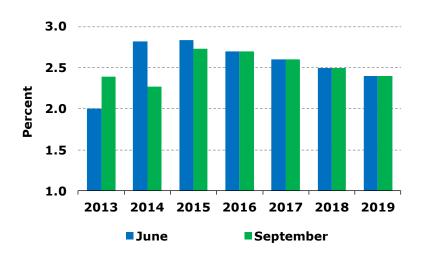

The Blue Chip Consensus GDP forecast, our starting point each forecast cycle, now calls for real GDP growth of 2.1% in 2014, down from 2.2% from the previous forecast. Real GDP contracted in the first quarter, largely due to severe winter

conditions impacting economic activity, and then rebounded sharply in the second quarter. For the remainder of 2014, GDP growth is expected to moderate in the second half of this year, growing 2.8% (SAAR) and 3.0% (SAAR) in the third and fourth quarters. The June forecast expected growth of 3.2% (SAAR) in the second half of the year. Real GDP growth is expected to increase to 3.0% in 2015, down slightly from the 3.1% growth expected in June. The forecast then calls for GDP growth to slowly trend down from 2.9% in 2016 to 2.5% in 2019, unchanged from the June forecast.

Consumer spending will not be a strong driver of GDP growth The forecast for consumer spending growth is also down slightly from the June forecast. While consumers are starting to feel more optimistic, stagnant wage growth has impeded spending. Despite the absence of increased real wages, the jobs recovery has continued at a modest pace. Home values and equity markets continue to increase as well, adding to net wealth. Much like the recovery so far, personal income growth will remain modest and consumer spending will not be a strong driver of growth in the recovery as is usually the case. We expect real consumer spending growth of 2.3% in 2014 before increasing to 2.7% in 2015 and 2016. We then expect consumption growth to moderate throughout the remainder of the forecast, reaching 2.4% in 2019 (see Figure 1.4). The forecast calls for consumer spending to contribute 1.9 percentage points to GDP growth this year and then contribute 1.8 percentage points to overall GDP growth annually for the remainder of the forecast.

Figure 1.4: U.S. Real Consumption Growth

The forecast calls for lower real consumption growth this year and next

Source: U.S. Bureau of Economic Analysis, ERFC September 2014 forecast; historical data through 2013

Personal income growth will pick up Real disposable personal income growth is expected to rebound to 2.5% this year after declining 0.2% in 2013. This is much higher than the 1.8% growth we expected in June due to stronger growth in the first half of the year than originally

estimated. We then expect growth in real disposable personal income to pick up to 2.7% in 2015 and reach 4.0% in 2017. Growth is then expected to moderate, growing 3.3% in 2018 and 3.1% in 2019. Nominal disposable income is expected to grow 4.0% this year, led by strong wage growth, particularly in the private sector. Wages and salaries are expected to grow 4.9% this year, the strongest growth since 2007, and maintain this level of growth throughout the forecast. Income will also be boosted throughout the forecast by strong growth in dividend and interest income as interest rates rise and equity markets continue to increase.

The outlook for employment has been lowered slightly Payroll employment growth is expected to be slightly lower this year than anticipated in the June forecast. Going forward, the forecast has been reduced slightly in terms of the total number of jobs. Growth in payrolls is expected to be 1.8% this year, down from the 1.9% growth forecasted in June. Even with the downward revision, employment growth is still expected to be higher than the 1.7% growth in 2013 and the highest annual growth since 2006. We expect employment growth of 1.8% in 2015, trending down to 0.7% in 2019. The forecast calls for the U.S. economy to add about 212,000 jobs per month through the end of this year as private sector gains continue and public sector hiring slowly increases. We expect employment growth to average 201,000 jobs per month for 2015 and 2016. The forecast calls for job growth to slow through the end of the forecast, averaging just 80,000 jobs per month in 2019 as labor force growth slows due to retiring baby boomers. As a result of the steady job growth, we expect the unemployment rate to drop over a full percentage point in 2014 to 6.3%, then to gradually fall to 5.3% in 2018 and 2019.

Private sector hiring will continue to outpace public sector hiring Employment growth in nonfarm payrolls has been led by private sector hiring throughout the recovery as the public sector has been weighed down by budget concerns. While state and local governments have largely worked through their budgetary issues and have started hiring again, the federal government continues to shed jobs. We expect the drag from weak government job growth to continue through 2016 and into the first part of 2017. Private sector employment is estimated to have reached 116.6 million in the second quarter of this year, making up all of the iobs lost during the recession. We don't expect the job losses in the public sector to be made up until the first half of 2019. Federal government employment will continue to decline throughout the forecast, but this will be offset by modest gains in state and local government employment. The forecast calls for total government employment to increase 0.2% this year after declining in each of the previous four years. Growth in government payrolls will slowly increase throughout the forecast, reaching 1.1% in 2017 and 2018 before moderating to 1.0% in 2019. We expect private sector job growth of 2.1% this year and in 2015, matching the increase from 2013. The forecast calls

for private sector job growth to gradually moderate throughout the remainder of the forecast to just 0.6% in 2019.

Business investment is improving

Business investment continues to improve. Vacancy rates for office buildings are still high but remain on a slow downward trend. Some of the existing empty office space is becoming obsolete, creating demand for new office space to meet businesses' changing needs. Companies have a high level of cash on hand, profits are strong, and borrowing rates remain low. We expect nonresidential construction to rebound with 6.9% growth this year, up from a 0.5% decline in 2013. The forecast calls for growth to weaken to 1.3% in 2015 before picking back up with growth of 6.5% in 2016, and reaching 9.7% in 2017. The forecast then calls for growth to moderate through 2019. Equipment investment is expected to have strong growth throughout the forecast as businesses improve productivity as they expand. Although we do not expect to see double-digit growth experienced early in the recovery, we do expect capital equipment to remain an important driver of GDP growth going forward. Investment in equipment and software is expected to grow 6.0% this year and then peak at 8.1% in 2015. The forecast then calls for growth to gradually moderate to 3.9% in 2019. We expect overall real nonresidential fixed investment to grow 5.4% this year, 5.8% in 2015, 6.1% in 2016, and reach 6.5% in 2017. Growth will moderate from there at 5.3% in 2018 and 3.5% in 2019.

The modest housing recovery will continue

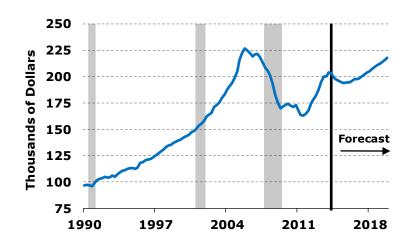

The housing recovery remains modest. We expect growth in housing starts to continue in the second half of the year now that the temporary effects of severe winter weather have been worked through. The forecast calls for growth of 10.0% for 2014, down from the 18.6% growth in 2013. Mortgage rates for a conventional 30-year fixed rate mortgage will continue to rise from 4.2% this year to 6.1% in 2018 and 2019. Much of the surplus of distressed properties caused by the recession has been worked through. Continued improvement in the housing market remains dependent on job growth and access to financing. The forecast expects robust growth in housing starts to continue in the near term. Growth in single-family starts is expected to be 4.9% this year, weighed down from the weak first quarter. Growth will further increase to 31.1% in 2015 and 28.7% in 2016, reaching 1.0 million units early in the year. Growth will remain strong in 2017 at 6.6% before flattening in 2018 and 2019. The multi-family housing segment is expected to moderate from the robust growth the past three years. The forecast calls for 11.7% growth this year before slowing to 0.4% in 2016. Going forward, we expect the multi-family segment to remain in the 400,000 to 420,000 unit range annually. The housing market will continue to improve, particularly while interest rates remain low by historical standards and inventories are lean. Population remains on an upward trend and employment continues to increase at a modest pace. The number of housing units remain at historically low levels and

there is considerable pent up demand created by the recent lack of household formation. The forecast calls for total housing starts to reach 1.58 million in 2017 and remain at that level through 2019.

The pause in home price appreciation will be temporary Home prices, which had been increasing at double-digit rates, are beginning to decline. We do expect the pause in appreciation to be temporary, and home prices to increase as the housing recovery unfolds (see Figure 1.5). The inventory of distressed properties, which hold down home values, is slowly being worked through. First-time home buyers remain on the sidelines due to still tight credit standards and emerging affordability issues. Investor demand, which had been propping up overall housing demand in recent years, is falling as fewer housing markets are undervalued. The forecast calls for the median price of an existing single-family home to peak at \$200,700 in 2014. We then expect the price to drop to \$196,400 in 2015 before once again slowly appreciating. The forecast calls for the median price to reach \$215,300 in 2019, just below the \$222,000 peak in 2006.

Home prices will appreciate after a brief slowdown

Source: National Association of Realtors, ERFC September 2014 forecast; historical data through 2014Q2

Weak foreign demand has weighed down export growth Export growth will continue to be weighed down by weak foreign demand for U.S. goods and services in the near term. Europe has just emerged from a prolonged recession and economic activity remains low. With severe structural imbalances in member countries and strict austerity measures still in effect, we expect the slow growth to continue. The latest Blue Chip forecast calls for 0.9% growth this year for the Eurozone followed by 1.5% growth in 2015. The weak economic growth has led to painfully high unemployment with rates for the Eurozone as a whole above 10% for the past three years. This has had an

adverse effect on consumer spending and reduced the exports of U.S. firms to Europe. The weakness in Europe has contributed to a slowdown in growth in other important U.S. trading partners as well. China, which is our largest export market outside of North America, in particular has slowed. Chinese growth remains well below their recent history and has prompted the government to introduce new stimulus measures. The latest Blue Chip forecast calls for growth of 7.4% in 2014 and 7.2% in 2015 for China. This is far below the Chinese growth seen from 2005 through 2011 of 11% and not enough to generate strong U.S. export growth.

Growth in some U.S. export markets is set to increase GDP growth in other major U.S. export markets is forecasted to increase, offsetting some of the loss of demand from Europe and China. The forecast calls for growth in U.S. trading partners to increase to 2.5% this year after growing 2.3% in 2013. GDP growth for these countries is expected to increase further, reaching 3.4% in 2017 before gradually slowing to 3.2% in 2019. This growth will fuel demand for U.S. exports. We expect real U.S. export growth of 2.5% this year, down from 3.0% in 2013, before rebounding to 5.1% in 2015. The forecast calls for export growth of 4.2% in 2016, improving to 6.1% by 2018 and 6.0% in 2019 as global economic conditions firm. Export growth is offset by increased imports starting this year, however. Net exports are expected to reduce overall GDP growth by 0.2 percentage points in 2014. Going forward, net exports are expected to reduce GDP growth by 0.2 percentage points on average through 2019 as the U.S. economy recovers and import growth picks up.

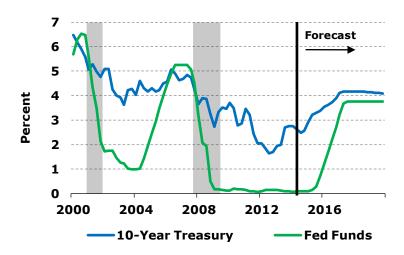

Policymakers remained focused on deficit reduction While uncertainty surrounding fiscal policy remains low, policymakers remain focused on deficit reduction. The forecast calls for an \$89.7 billion reduction in the federal deficit between 2013 and 2015. After dropping sharply in 2013 by \$51.0 billion, we expect real defense spending to decline another \$21.4 billion in 2014 and then fall gradually through the remainder of the forecast by an average of \$4.1 billion per year. Real nondefense purchases will decline as well throughout the forecast. We expect a \$6.6 billion decline this year followed by a \$2.4 billion reduction on average through 2019. With the prospect of expanded military action in the war against Islamic militants in Syria and Iraq, defense spending may be increased in the near term. Even with the potential increase, however, nondefense spending cuts might be required to offset them. The forecast calls for 2014 to be the trough in total real government purchases. We expect low growth for the remainder of the forecast, gradually increasing to 0.7% in 2017 through 2018 and 0.6% in 2019.

The Fed is starting to end its loose monetary policy The Federal Reserve is now beginning to end its loose monetary policy it has used to support the economy. With the economic recovery continuing to firm, the first steps have now been taken

to end the Federal Reserve's unconventional policies aimed at boosting the recovery. In October, the Fed will end its bond buying program that has kept interest rates low. There will then be roughly \$4.2 trillion in various assets on its balance sheet that will take years to unwind. The forecast calls for Fed policymakers to begin to raise interest rates in the third quarter of 2015. While the forecast still assumes inflation will be low and the labor market relatively weak, it is still anticipated that the Fed will be comfortable raising rates. Going forward, we expect rates to rise gradually before leveling off in 2017 (see Figure 1.6).

Figure 1.6: Yield on 10-Year Treasury Notes and Fed Funds Rate

Rates are expected to rise next year

Source: Federal Reserve, ERFC September 2014 forecast; historical data through 2014Q2

Oil prices are expected to decline on increased production The forecast for oil prices is lower in the near term than in June, although prices decline at a slower rate as the forecast unfolds. Turmoil in oil-producing countries has continued, although markets seem to be less affected than in the past. Libya's oil production has climbed to 900,000 barrels a day as the country was able to restart conflict-damaged refineries. Production is now close to the pre-revolution capacity of 1.6 million barrels per day. Escalating violence in Iraq and sanctions against Russia have not severely impacted prices. Weak economic growth in China and Europe has slowed growth in demand. The International Energy Agency lowered their global demand forecast to growth of 900,000 barrels a day this year to 1.2 million barrels per day next year. At the same time, U.S. Energy Department estimates that growth in U.S. production alone will be enough to meet the increase in demand. We expect declining prices throughout the forecast, falling from about \$97 per barrel this year to \$89 per barrel in 2019. In addition to declining oil prices, the modest recovery will keep inflation subdued. We expect low headline inflation throughout the forecast ranging from 1.8% to 1.3%.

Table 1.1 provides a fiscal year summary of the U.S. economic indicators. For calendar year tables, see the appendix.

#### **Risks to the Forecast**

Downside
risks
outweigh
upside risks

Our view of the risks to the forecast has changed since the June forecast. The probability of the optimistic scenario has been lowered while the probability of the baseline scenario has been raised. The largest change since the last forecast has been a lowered chance of robust recoveries in the labor market and housing market. The level of uncertainty in the baseline remains high. However, downside risks outweigh upside risks.

#### **Downside Risks (25% Probability)**

Fiscal
tightening

Policymakers misinterpret weak growth and depressed confidence, decide on austerity, and cut discretionary spending, further reducing growth. Private sector confidence plummets, lowering stock prices and economic activity.

#### Sovereign debt contagion

Sovereign debt worries reemerge in the southern periphery of the European Union and the EU Commission re-imposes fiscaltightening programs. Europe returns to recession and continued austerity measures increase the financial strains in Eurozone countries.

# Slow Chinese growth

Global growth is restrained by a hard landing (growth <5%) in China. This leads to weaker growth in emerging economies in particular.

#### Crisis in Ukraine escalates

Tensions in Ukraine escalate, destabilizing the region. Oil shipments and financial linkages to Europe are stressed.

#### Middle East collapses

The conflict in Iraq and Syria escalates. Major oil infrastructure is compromised, reducing supply globally. The U.S. expands it military presence.

#### Declining stock market

Declining stock market weakens confidence, resulting in a drop in spending. Businesses are no longer willing to expand.

# No housing recovery

The housing-sector recovery never materializes. Declining affordability and tight supply remove the option for homeownership for many potential buyers.

#### **Upside Risks (20% Probability)**

# Housing recovery ignites

The housing sector improves faster than anticipated. Home prices continue to increase and buyers move off the fence. Affordability is not a major issue as income gains offset any increase in interest rates. Homebuilders respond and housing starts increase, leading to more hiring.

Confidence Pent-up demand, fueled by a rebound in confidence, boosts improves, consumer spending after years of economizing. Stock market boosting gains reduce the desire for excess savings, further boosting spending spending. The recent trend of solid payroll gains continues, and the labor Virtuous labor market market recovery gathers steam. This triggers a virtuous cycle of cycle jobs, income, spending, and yet more jobs. The European Central Bank expands its monetary base, Eurozone successfully leading the Eurozone away from deflation. They also rebounds develop a credible pro-growth plan to tackle sovereign debt from issues. stagnation Emerging market GDP growth accelerates. Global growth picks Emerging up and U.S. exports are boosted. Businesses expand production markets in response.

rebound

Chapter 1 23

# Chapter 2: Washington Economy – Current Conditions and Forecast

- As expected in the June forecast, the Washington economy continues to expand at a moderate pace.
- Washington employment growth has been stronger than expected in June and historical estimates were revised higher.
- Overall housing construction is on track but single-family permits are weak.
   Seattle home prices have declined in two of the last three months.
- Since the recession, Washington consumer spending growth has been positive but weak.
- The annual revision raised the estimated level of Washington personal income in 2013 by \$4.403 billion (1.3%).
- Seattle shelter costs are rising much faster than the national average but overall inflation remains modest.
- We expect the Washington economy to continue to outperform the U.S. economy.

#### **Current Conditions**

The Washington economy continues to show moderate growth

In recent months the Washington economy has performed slightly better than expected in the June forecast. The current level of employment is higher than anticipated in June both because growth has been stronger than expected and because historical estimates have been revised up. As anticipated, Washington personal income growth was weak in the second quarter, largely due to aerospace bonuses paid in the first quarter which were not repeated in the second quarter. Single-family housing construction was once again weaker than expected in the second quarter of 2014 but overall construction was close to the forecast thanks to strong multi-family construction. Seattle area inflation is about the same as the national rate. Shelter costs are rising faster than elsewhere in the U.S. but other prices are rising more slowly.

Job growth has been...

In the three months since the June forecast was adopted, the Washington economy added 21,600 jobs, 3,200 more than the

...stronger than expected 18,400 expected in the June forecast. As usual, most of the new jobs were in private-services providing industries which added 15,200 jobs in June, July, and August. The manufacturing sector added 2,100 jobs in the three-month period thanks in part to an unexpected increase of 1,200 jobs in the aerospace industry. (We believe the increase in aerospace was due to temporary summer interns and will be reversed in the fall.) The construction sector added 2,500 jobs in June, July, and August while federal, state, and local government combined added 1,800 jobs. The state's unemployment rate was 5.6% in August, the same rate as in July but down from 7.0% in August 2013.

Historical employment data were revised up We have also incorporated another quarter of benchmark employment data from the Quarterly Census of Employment and Wages (QCEW). The new QCEW data and other revisions raised the estimated level of total employment in May 2014 by 8,000 jobs. As a result of the upward revisions to history through May and slightly stronger-than-expected growth in the next three months, the total effect is 11,200 (0.4%) more jobs in August 2014 than expected in the June forecast.

Initial claims continue to trend lower

In another sign of labor market healing, initial claims for unemployment insurance continue to trend lower and are now at pre-recession levels. The four-week moving average of Washington initial claims for unemployment insurance edged up to 8,069 in the week ending September 20<sup>th</sup> from 8,024 in the previous week but is still lower than at the onset of the recession.

Hourly earnings growth is improving

Growth in average hourly earnings has picked up, but average weekly hours continue to trend down. Private sector average hourly earnings in the twelve months ending in August 2014 were up 2.0% over the previous twelve month period. A year ago the comparable rate of increase was only 0.6%. However, average weekly hours declined 0.2% in the most recent twelve month period compared to the previous year. This is better than the 0.4% decline in the previous year, but still negative. As a result of the improvement in average hourly earnings, average weekly earnings growth improved to 1.8% compared to 0.6% a year ago.

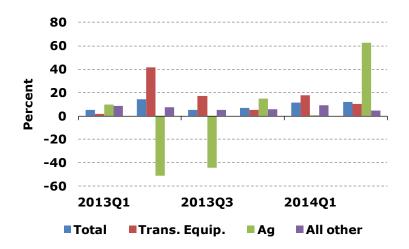

Export growth is strong

Washington exports increased 11.9% in the second quarter of 2014 compared to the second quarter of 2013. Exports of transportation equipment (mostly Boeing planes) increased 10.4% over the year and exports of agricultural products jumped 62.5% over the year. Exports of all other Washington commodities rose 4.6% over the year (see Figure 2.1).

Chapter 2 26

Agricultural exports rebounded in the second quarter

Figure 2.1: Washington Export Growth

Source: WISER Trade; data through 2014 Q2

Overall housing is on track but single-family permits are weak

Single-family housing construction was once again weaker than expected in the second quarter of 2014 but overall construction was close to the June forecast thanks to stronger-than-expected multi-family construction. Total housing units authorized by building permits averaged 37,200 (SAAR) in April, May, and June. The June forecast had assumed 37,400 units. Single-family units averaged 16,600, 800 less than expected but multi-family units averaged 20,600, 600 more than expected. As expected, the third quarter started out weaker than the second quarter as July and August multi-family permits came down from an unsustainably high second-quarter level. Multi-family permits in July and August still exceeded the June forecast, more than making up for a shortfall in single-family permits. Total permits averaged 32,300 units (SAAR) in July and August compared to the June forecast of 32,600 units for the third quarter as a whole.

Seattle-area home prices may be peaking Seattle home prices may be peaking. According to the S&P/Case-Shiller Home Price Indices, seasonally adjusted Seattle area home prices declined 0.1% in July. Seattle home prices have now fallen in two of the last three months after 29 consecutive monthly increases since the trough in November 2011. Seattle home prices are still up 7.1% over the previous July and 26.1% higher than the November 2011 trough.

Layoffs are coming in the software industry

In July Microsoft announced that it would lay off 18,000 employees worldwide. The majority of these are related to the Nokia acquisition and will not be in the Puget Sound area. Nevertheless, the local impact will be significant. In July, 1,351 Washington employees were notified of layoffs. Another 747 were notified in September for a total of 2,098. This is comparable to the 2,101 Microsoft employees laid off in 2009. There remain approximately 2,900 Microsoft job cuts remaining,

some of which will undoubtedly be local. The layoffs should be complete by the end of the Microsoft fiscal year which is June 30, 2015.

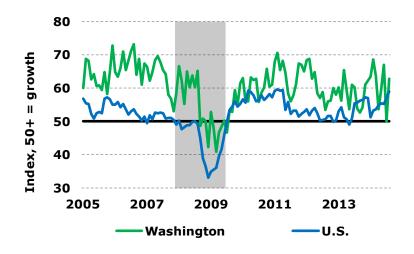

Aerospace employment is declining Aerospace employment, which had been responsible for much of the strength in manufacturing early in the recovery, is now in decline. As of May 2014, aerospace lost 3,400 jobs since the peak in November 2012. Aerospace employment actually increased by 1,200 in June, July, and August but we believe the increase was due to temporary summer interns and will be reversed in the fall. We continue to believe that this downturn will be relatively mild due to the hefty backlog of orders. The current reductions are due to improvements in productivity and restructuring. The steep cuts in the past have been associated with production cuts which we do not expect over the next few years.

Manufacturing continues to expand

The Institute of Supply Management - Western Washington Index (ISM-WW) rebounded to 62.9 in August from 50.1 in July (see Figure 2.2). Index values above 50 indicate positive growth while values below 50 indicate contractions. The July figure was the weakest since July 2009, at the depth of the recession. All components (production, orders, employment, inventory, and deliveries) improved in August.

The ISM-WW index bounced back in August

Figure 2.2: Institute of Supply Management Indices

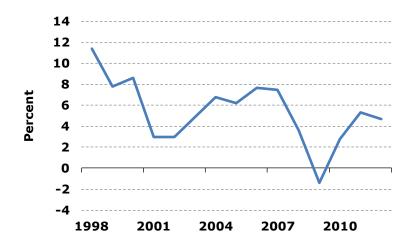

Source: ISM, ISM-WW; data through August, 2014

Car sales reached a new postrecession high in August Washington car sales reached yet another post-recession high in August 2014. New vehicle registrations totaled of 291,400 (SAAR) in August, 0.2% more than in July and 5.2% more than in August 2013. New vehicle registrations for August were the strongest since November 2007, before the onset of the recession.

Nominal Washington consumer spending declined in 2009 In August the U.S. Bureau of Economic Analysis released, for the first time, estimates of personal consumption expenditures (PCE) by state for 1997 through 2012. These estimates are not adjusted for inflation. Washington personal consumption expenditures rose 4.7% in 2012 compared to 4.1% for the nation. Washington's 2012 consumption growth rate ranked ninth strongest among the states and District of Columbia. Washington consumer spending fell 1.4% in 2009, at the bottom of the most recent recession, in stark contrast to the 2001 recession when consumer spending growth never fell below 3.0% (see Figure 2.3). While consumer spending growth returned to positive territory in 2010, 2011, and 2012, growth remains weaker than during the previous recovery.

Since the recession, Washington consumer spending growth has been positive but weak

Figure 2.3: Washington Consumer Spending Growth

Source: U.S. Department of Commerce, Bureau of Economic Analysis; data through 2012

Second quarter personal income growth was skewed by Boeing bonuses in the first quarter In late September, the Bureau of Economic Analysis released estimates of state personal income through the second quarter of 2014. Washington personal income grew at a 5.8% rate (SAAR) in the second quarter which ranked 38th among the states (including the District of Columbia) and was slightly lower than the 6.3% annual rate for the U.S. as a whole. Washington's growth in the second quarter was skewed by the very large bonus payments paid by Boeing in the first quarter. Excluding durable manufacturing wages, Washington's second quarter growth was 6.8% which ranked 15<sup>th</sup> among the states and District of Columbia and exceeded the 6.2% rate for the U.S. as a whole.

Historical personal income was boosted by a revision in dividend income

The September BEA release also reflected the annual revision of state personal income. Annual revisions are made "to incorporate source data that are more complete and more detailed than previously available." The annual revision raised the estimate of Washington personal income in 2013 by \$4.403 billion (1.3%)

compared to the previously available estimate. The revision was more than accounted for by a \$5.108 billion (7.9%) increase in the estimate for dividends, interest, and rent. According to the revised estimates, Washington personal income increased 2.5% in 2013 which ranked 10th fastest among the fifty states and District of Columbia. The comparable national growth rate was 2.0%.

Seattle-area shelter costs are rising rapidly Seattle shelter costs continue to rise much more rapidly than U.S. city average shelter costs but other prices are rising much more slowly, with the result that headline inflation in Seattle is close to the national average. The Seattle CPI rose 1.8% from August 2013 to August 2014 compared to 1.7% for the U.S. city average. Similarly, core prices (all items excluding food and energy) increased 1.7% in Seattle, the same rate as the U.S. city average. However, shelter costs rose 4.4% over the year in Seattle compared to 2.9% for the U.S. city average. All items excluding shelter rose only 0.6% in Seattle compared to the national average increase of 1.2%.

# **Washington State Forecast**

The September Washington forecast reflects a very similar U.S. forecast The September Washington State forecast is based on a new national forecast that is very similar to the forecast adopted in June. While real GDP is lower in the new forecast, the reason is a downward revision in historical estimates resulting from the annual revision of the national income and product accounts (NIPAs). GDP growth in the forecast averages 2.7% per year through 2019, the same rate as in the June forecast. Employment growth averages 1.4% per year, real personal income growth averages 3.3% per year and PCE inflation averages 1.5% per year, all the same as in June. Oil prices, however, are lower than assumed in June in the near-term but also decline less. These minimal revisions in the national forecast feed through to the state economic forecast.

Washington will continue to outperform the U.S. in growth Our September 2014 forecast of Washington employment is higher than assumed in June due mainly to stronger than expected growth through August. Employment growth for the remainder of the forecast is also slightly higher than in the June forecast. Our current estimate of Washington personal income growth in the first half of 2014 is also higher than anticipated in the June forecast, resulting in a stronger forecast for 2014. Our new forecast for nominal personal income growth from 2015 through 2019 is also slightly higher than the rate predicted in June. The number of housing units authorized by building permits was close to the forecast in the second quarter of 2014. Once again the multi-family segment was stronger than expected but single family construction was weaker. As a result, we have slightly lowered our single-family housing permit forecast and raised our multi-family forecast. Our September economic

forecast for total Washington housing units is very similar to the forecast adopted in June.

# **Washington Payroll Employment**

Employment growth is stronger in 2014 than assumed in June

Our September 2014 forecast of Washington employment is higher than assumed in June due mainly to stronger than expected growth through August. Washington employment is expected to grow 2.6% this year compared to the 2.3% growth assumed in the June forecast. The September forecast for average annual employment growth from 2015 through 2019 is 1.6% per year compared to 1.5% per year in the June forecast.

Aerospace employment is slowly declining Despite rising production, aerospace employment continues to decline. Aerospace employment usually peaks before production as developers and testers are laid off and productivity improves. Aerospace employment has performed about as expected during the last three months and we have not changed our expectation of a downward trend over the next few years. However, we believe that this downturn will be relatively mild due to the large backlog of orders. The current reductions are due to improvements in productivity whereas the steep cuts in the past have been associated with production cuts, which we do not expect over the next few years. On an annual average basis, we expect aerospace employment to decline 2.5% in 2014, 2.6% in 2015, 2.5% per year in 2016 and 2017, 2.2% in 2018, and 2.0% in 2019.

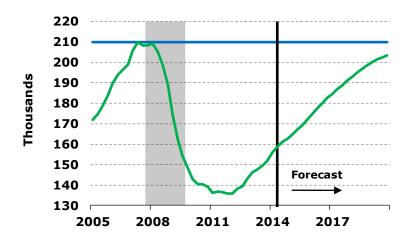

Software employment will be weak in the near term as the sector absorbs Microsoft layoffs Software employment has been growing steadily since the 2009 Microsoft layoffs. As of the third quarter of 2014, employment exceeded the previous peak by 3,300 jobs. The recently announced Microsoft layoffs will begin in September 2014 and will affect annual employment growth rates in 2014 and 2015. After that we expect moderate positive growth to resume, however the level of software employment will be lower than assumed in June throughout the remainder of the forecast. Software employment rose 3.0% in 2013 which was the highest growth rate since 2008. We expect a growth rate of 2.7% in 2014 followed by a 0.5% decline in 2015. Positive growth is expected to return in 2016 with growth averaging 1.2% per year in each through 2019.

Construction employment is growing faster than we believed in June Construction employment growth continues to surprise on the upside. We have increased our forecast of construction employment growth this year to 7.2% compared to 6.3% in the June forecast. This will make 2014 the best year for construction employment growth since 2006. Most of the growth this year will be in residential construction with nonresidential construction employment growth picking up in 2015-2019. Overall construction employment will grow 5.5% in 2015, 6.2% in 2016, 5.0% in 2017, 4.4% in 2018, and 3.1% in 2019. Even with these impressive growth rates, construction employment will still be

6,500 below its previous peak at the end of 2019 (see Figure 2.4).

Washington construction employment will remain below its previous peak

**Figure 2.4: Washington Construction Employment** 

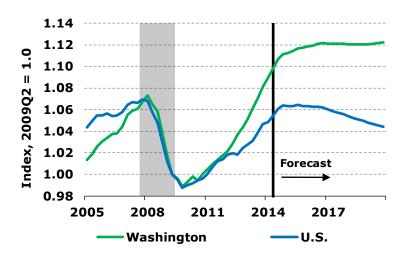

Source: WA Department of Employment Security, ERFC September forecast; historical data through 2014  $\rm Q2$ 

Financial activities employment will decline in 2016-19 Financial activities employment fell 19,400 jobs (12.2%) from a peak in the first quarter of 2006 to the trough in the second quarter of 2010. Employment in credit intermediation and related activities accounts for most of the decline, followed by real estate and rental and leasing. On a calendar year basis, financial activities employment grew 0.2% in 2011, 2.4% in 2012, and 4.1% in 2013. Going forward, we expect a declining trend in financial activities employment due to productivity growth and outsourcing. Employment will grow only 1.8% in 2014 and remain flat in 2015 before declining 0.9% in 2016, 2.6% in 2017, 2.1% in 2018, and 0.7% in 2019.

Retail trade employment has rebounded Retail trade is another highly cyclical sector that declined early and sharply but has now turned around. Growth in Washington has been much stronger than the national average during the recovery thanks to our outsized and rapidly growing electronic shopping sector (see Figure 2.5). Retail trade employment grew 1.5% in 2011, 2.1% in 2012, and 3.3% in 2013 following declines of 0.2%, 5.5%, and 0.4% in 2008, 2009, and 2010. We expect another year of 3.3% growth this year based on employment data through August. The forecast assumes weaker growth in the next five years as the recovery matures. We expect growth rates of 1.3%, 0.4%, 0.1%, 0.0%, and 0.1% in 2015 through 2019.

Figure 2.5: Retail Trade Indices

Washington retail trade employment growth has been much strong than the national average during the recovery

Source: WA State Employment Security Department, BLS, ERFC September 2014 forecast; historical data through 2014 Q2

We expect strong growth in professional and business services employment As is typical during recoveries, professional and business services will be one of Washington's fastest growing sectors. During a recovery, growth in this sector is boosted by gains in employment services, mainly temporary help services. As businesses gauge whether the increase in demand will continue, they typically hire temporary staff before they hire permanent employees. Employment growth in professional and business services rebounded to 4.0% in 2011 from just 0.6% in 2010 and a 6.9% decline in 2009. Growth slowed to 3.1% in 2012 and 2.9% in 2013 due to a slowdown in employment services and big cuts in waste management (Hanford) and accounting services. We expect growth to remain very strong in this sector throughout the forecast with growth rates of 2.9%, 5.0%, 4.3%, 3.0%, 2.2%, and 2.3% in 2014 through 2019.

State and local government employment is growing again

State and local government employment was a drag on the overall jobs recovery long after most other sectors turned around but has finally passed its trough. State and local government employment peaked in the fourth quarter of 2008 and declined through the first quarter of 2012. Since then, employment levels have risen steadily but slowly. On an annual average basis, state and local government employment rose 0.8% in calendar 2013 following three years of decline. While we expect growth to improve, employment in the state and local government sector will not regain its previous peak until the first quarter of 2015. We expect moderate employment growth in 2014 through 2019 with growth rates of 1.3%, 1.2%, 1.4%, 1.6%, 1.6%, and 1.3%.

# **Washington Personal Income**

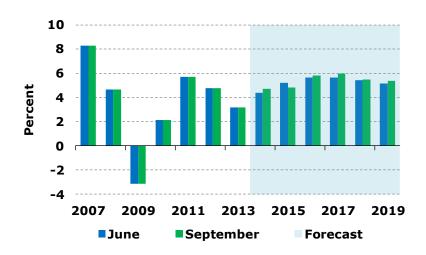

The current level of personal income is higher than expected in June

In late June, the Bureau of Economic Analysis released estimates for state personal income through the first quarter of 2014. We have incorporated the new BEA estimates as well as additional Washington QCEW and other wage data through the first quarter. Our current estimate of Washington personal income in the first quarter of 2014 is \$338.2 billion which is \$0.5 billion (0.2%) higher than assumed in June. Also, monthly U.S. personal income growth, a key driver of the Washington personal income estimates, has been stronger than expected so far in 2014, mostly in the transfer payments component. As a result, our estimate for personal income in the second quarter is \$1.1 billion (0.3%) more than expected in June.

Higher actuals in the first half raised our forecast for 2014 income growth Our September forecast for nominal personal income growth this year of 4.7% is stronger than the June forecast of 4.4% due to the higher actuals in the first half of 2014. Our new forecast for nominal personal income growth from 2015 through 2019 averages 5.5% per year, slightly higher than the 5.4% rate predicted in June (see Figure 2.6). The higher nominal income growth forecast in 2015-19 reflects the slightly higher inflation in the new forecast. Real income growth in 2015-19 is forecasted to average 3.9% per year, the same rate expected in the June forecast.

Figure 2.6: Washington Personal Income Growth

Personal income growth is higher than assumed in the June forecast

Source: U.S. Department of Commerce, Bureau of the Economic Analysis, ERFC September 2014 Forecast; historical data through 2013  $\,$ 

# **Washington Building Permits**

The total housing permit forecast is...

The number of housing units authorized by building permits was close to the forecast in the second quarter of 2014. Once again the multi-family segment was stronger than expected but single

... very similar to the June forecast family construction was weaker. As a result, we have slightly lowered our single-family housing permit forecast and raised our multi-family forecast. Our September economic forecast for total Washington housing units is very similar to the forecast adopted in June. We expect total housing units to rise 3.3% to 34,100 units in 2014, 6.0% to 36,100 units in 2015, 13.8% to 41,100 units in 2016, and 3.5% to 42,500 units in 2017. Housing permits are expected to level off in the last two years, rising only 1.3% to 43,000 in 2018 and 2.8% to 43,800 in 2019.

#### **Seattle Consumer Price Index**

Inflation will remain moderate throughout the forecast

Core inflation (excluding food and energy) in Seattle slowed to 1.5% in 2013 from 2.6% in 2012. As the economic recovery continues, Seattle core inflation will increase but remain in a moderate range. We expect the core Seattle CPI to rise 2.3% and 2.2% in 2014 and 2015, slowing to 1.9% in 2016, 2.0% in 2017, 1.9% in 2018, and 1.8% in 2019. We expect declining oil prices during the remainder of the forecast which should further restrain headline inflation. We expect all-items Seattle area inflation rates of 2.3% in 2014, 2.2% in 2015, 1.7% in 2016, 1.9% in 2017, 1.9% in 2018, and 1.8% in 2019.

Table 2.1 provides a fiscal year summary of the state economic indicators. For calendar year tables, see the appendix.

#### **Alternative Scenarios**

Alternate forecasts are prepared in accordance with state law

In accordance with state law, the Washington State Economic and Revenue Forecast Council adopted a forecast based on optimistic assumptions and a forecast based on pessimistic assumptions.

#### **Optimistic**

In the optimistic scenario, the European Central Bank (ECB) expands its monetary base, successfully steering the Eurozone away from deflation. Eurozone growth strengthens more than in the baseline as fiscal conditions improve, credit conditions ease, and pent-up demand is released. The euro appreciates in response to the ECB's policy changes, as well as to changes in interest rates and economic performance. GDP growth in the major economies reaches 2.7% in the third guarter. Emergingmarket GDP growth accelerates as these markets implement structural reforms to increase labor productivity, and their exchange rates appreciate against the U.S. dollar. As global growth picks up, the dollar depreciates 3.6% against most major currencies in the third quarter of 2014. The S&P 500 jumps in the third quarter and stays above the baseline level throughout the forecast period. The exchange-rate depreciation begins to impact international trade about a year after it begins. Fixed

In the optimistic scenario, the Eurozone recovers faster than expected

The optimistic scenario also assumes a much stronger Washington economy

nonresidential investment expands 6.3% in 2014, 8.4% in 2015, and 7.9% in 2016. The increased production capacity allows export growth to take off. Greatly increased production capacity brings significant wage and payroll gains. As employment and wage growth both pick up, they lift the pace of consumption growth.

In addition to reflecting the impact of the stronger U.S. forecast on the state economy, the optimistic Washington forecast assumes that aerospace employment resumes an upward trend in the first quarter of 2014 through the second quarter of 2017 rather than continuing to fall as in the baseline. Software employment growth is also much stronger than in the baseline forecast. Seattle inflation is higher than in the baseline forecast due to the stronger regional economy as is average wage growth. The strong local economy also drives population growth higher. The recovery in construction employment is much stronger than in the baseline forecast with employment in the sector exceeding the previous peak in the third quarter of 2017. By the end of 2019, Washington nonfarm payroll employment is higher by 163,500 jobs than in the baseline forecast and Washington personal income is \$44.4 billion higher.

#### **Pessimistic**

The housing sector relapses in the pessimistic scenario

In the pessimistic scenario, the housing-sector rebound never materializes. Additionally, foreign growth weakens and consumer confidence sinks. Tight credit, a scarcity of developed lots, and rising construction costs restrain the housing market recovery and remove the homeownership option for more renters. Housing starts weaken, averaging 0.96 million in 2015. Consumption makes meager contributions to growth, driven down by less aggregate household-related expenditures. Federal government spending contracts sharply in the fourth quarter, and continues dropping in subsequent quarters. Without a credible stimulus plan on the horizon, private-sector confidence deteriorates, stock prices drop, and the U.S. economy wobbles. The declining stock market weakens confidence, resulting in consumer spending increasing only 1.4% in 2015. With businesses unwilling to expand further in such a weak environment, nonresidential fixed investment growth slows. Light-vehicle sales turn down again, falling to 15.8-million units (annualized) in the fourth quarter and below 15.0 million units in mid-2015. In this scenario, U.S. export growth declines because foreign growth is lower. The double squeeze from weak domestic sales and slow exports weakens businesses, initiating a slowdown in payroll growth. Meanwhile, some otherwise qualified job applicants are prevented from relocating to employment opportunities by a dismal real estate market. In turn, this leads to depressed wages, low profits, and declining employment, with the unemployment rate rising back above 6.5% in 2015.

This scenario also assumes a weaker local economy In addition to reflecting the impact of the weaker U.S. forecast on the state economy, aerospace employment declines much more rapidly in 2013 through 2019 than assumed in the baseline forecast. Software employment also begins to decline in the third quarter of 2014. Population growth is also weaker than in the baseline forecast as migration into Washington drops. Construction employment is essentially flat in the pessimistic alternative rather than rising as in the baseline. The Seattle CPI is lower than in the baseline forecast, as are Washington wage rates, further depressing personal income. By the end of 2019, Washington nonfarm payroll employment is 212,700 lower than in the baseline forecast and Washington personal income is \$37.6 billion lower.

Table 2.2 compares the optimistic and pessimistic forecasts with the baseline forecast.

#### **Governor's Council of Economic Advisors (GCEA)**

In the GCEA scenario, the U.S. and state forecasts were adjusted to match the average view of the Council members.

The
Governor's
Council
members
expect
weaker
output
growth but
higher
inflation

At the national level, the GCEA outlook for real GDP growth is slightly below the baseline forecast in every year except 2014. However, real consumer spending growth in the Governor's Council scenario was very close to the baseline forecast throughout the forecast. Despite the slower real GDP growth, the Governor's Council members expected consistently higher inflation than predicted in the baseline forecast. As a result of the higher inflation assumption, nominal consumption is higher in the Governor's Council scenario than in the baseline forecast. Compared to the baseline, the GCEA expects slightly higher oil prices in 2014 and 2015 but lower oil prices in 2016 through 2019. The Council members' mortgage rate forecast is very close to the baseline forecast.

The GCEA members expect weaker Washington real income growth but stronger nominal growth due to higher inflation

The GCEA scenario for Washington is also similar to the baseline forecast. Their real personal income growth forecast averages 3.4% per year in 2014 through 2019 compared to the baseline forecast of 3.8% but, because they expect higher inflation, their nominal personal income growth forecast is higher (5.4% versus 5.2%). The council members' forecast for total employment growth is slightly stronger on average than the baseline forecast. Overall, their forecast expects a 1.8% average rate through 2019 compared to 1.7% per year in the baseline forecast. The GCEA forecast for manufacturing employment is about the same as the baseline forecast. The Council members' construction employment forecast is lower than the baseline forecast but their housing permit forecast is higher. At the end of 2019, the GCEA forecast for Washington nonfarm payroll employment is 5,900 higher than in the baseline forecast but Washington personal income is \$3.6 billion lower. See Table 2.3 for more information.

# Chapter 3: Washington State Revenue Forecast Summary

- Revenue collections since June have come in \$115 million over the forecasted amount, but much of the variance was due to non-economic events.
- Changes to the economic forecast and taxable activity since the June forecast were small and mixed but the net result was slightly positive. They resulted in increases in expected revenue of less than one percent for each of the forecasted biennia.
- The forecast of General Fund-State (GF-S) revenue for the 2013-15 biennium was increased by \$163 million and the forecast for the 2015-17 biennium was increased by \$143 million. The forecast for the 2017-19 biennium was increased by \$164 million.

#### Overview

Changes to the revenue forecast in September were once again slight but positive Revenue collections since the June 2014 forecast came in \$115 million higher than the expected total. Most of the surplus came from Revenue Act taxes (retail sales and use, business and occupation, public utility and tobacco products taxes), which came in \$106 million above the forecast. While preliminary data indicate that second quarter economic activity was slightly higher than forecasted, much of the extra revenue was the result of lower-than-expected refunds and redemptions of tax credits rather than increased activity. As the reduced level of refunds and tax credits is not expected to continue, and changes to the economic forecast were slight, total forecasted revenue for the current biennium has been increased by only \$47 million above the current collection variance. Forecasted collections for the 2015-17 and 2017-19 biennia have been increased by similar amounts. As was the case in June, forecast increases amounted to less than one percent for each of the forecasted biennia.

GF-S forecast change by biennium (millions):

13-15: +\$163 15-17: +\$143

17-19: +\$164

Table 3.1 summarizes the changes to the forecasts of GF-S revenue for the 2013-15 and 2015-17 biennia. As of September 10<sup>th</sup>, revenue collections for the 2013-15 biennium were \$115.1 million ahead of the June forecast. For the remainder of the biennium, changes to the economic forecast have increased forecasted revenue by \$47.4 million. The sum of these changes

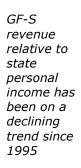

for the 2013-15 biennium is a forecast increase of \$162.5 million, with total biennial revenue of \$33,331.9 million. The forecast for the 2015-17 biennium has been increased by \$143.0 million and the forecast for the 2017-19 biennium has been increased by \$164.2 million. GF-S revenue is now forecasted to total \$36,078.2 million in the 2015-17 biennium and \$39,187.6 million in the 2017-19 biennium.

Figure 3.1: GF-S Revenue (Current Definition) as Percentage of State Personal Income (Fiscal Years)

Source: ERFC, data through fiscal year 2014 preliminary

The ratio of collections to income is at historical lows

As can be seen in Figure 3.1, the amount of GF-S revenue that is collected relative to state personal income is forecasted to reach its lowest levels in ERFC records. The ratio of revenue to income has been on a downward trend since 1995, broken only by the housing boom that raised the ratio from 2005 to mid-2008, and by temporary taxes and transfers of funds from non-GF-S sources into the GF-S that again boosted the ratio in fiscal years

2011 and 2013. The preliminary estimate of the ratio for FY 2014 is only slightly lower than that of FY 2013, but the September forecast, as shown in the light blue shaded area, has the ratio trending downward more or less continuously from FY 2015 through FY 2019.

Forecast details are at the end of the chapter The history of nominal and real GF-S revenue by biennium can be found in Table 3.3. GF-S forecast changes by agency and major revenue classification for the 2015-17 biennium can be found in Table 3.5 (cash) and Table 3.6 (GAAP). Forecast changes for the 2015-17 biennium can be found in Table 3.7 (cash) and Table 3.8 (GAAP). The GF-S forecast by fiscal year and major source category through FY 2019 can be found in Table 3.9.

# **Recent Collection Experience**

Cumulative receipts from major sources that are tracked monthly were \$115 million (3.1%) more than the lune forecast

Revenue collections from the Department of Revenue (DOR), Department of Licensing, Administrative Office of the Courts, and Lottery are tracked monthly. In the period since the June forecast, total revenue from the above sources came in \$115.1 million (3.1%) higher than expected (see Table 3.2). Revenue Act collections reported by the DOR were \$105.5 million (3.4%) above the forecast. Revenue from other DOR tax sources from June through August was \$9.8 million (1.7%) above the forecast.

Table 3.2: Pre-Forecast Collection Variance of Major General Fund-State Taxes by Agency (relative to the June 2014 forecast, cash basis, millions of dollars)

Agency/Source	Collection <u>Variance</u>	Percent of <u>Estimate</u>
Department of Revenue		
Revenue Act	\$105.5	3.4%
Non Revenue Act	\$9.8	1.7%
Subtotal	\$115.3	3.1%
Department of Licensing Administrative Office of the Courts	\$0.2 (\$0.4)	1.5% -1.9%
Total*	\$115.1	3.1%

<sup>\*</sup> Detail may not add to total due to rounding. Source: ERFC; Period: June 11 - September 10, 2014

Much of the positive variance in collections came from non-economic factors

While Revenue Act collections were well above the June forecast, much of the surplus was due to lower-than-expected refunds and redemptions of tax credits rather than increased activity. Real estate excise tax (REET) receipts also came in well above the forecast, beating it by \$20.2 million (12.2%). This surplus, however, was partially offset by shortfalls in other sources. The

biggest shortfall was in transfers of unclaimed property. Refunds of unclaimed property that had previously been transferred into the GF-S were \$11.2 million higher than forecasted. Property tax receipts were \$2.7 million (1.4%) lower than forecasted and liquor sales and liter tax receipts were \$0.6 million (0.9%) lower than forecasted. Cigarette tax receipts came in \$3.4 million (3.3%) higher than forecasted. Revenue from the Department of Licensing was \$0.2 million (1.5%) higher than forecasted and revenue from the Administrative Office of the Courts was \$0.4 million (1.9%) lower than forecasted.

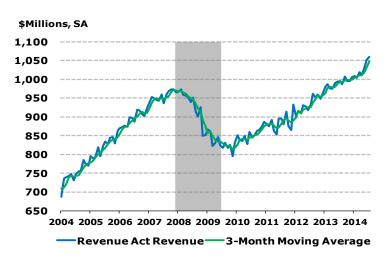

Adjusted Revenue Act collections were up 7.7% year over year in the most recent collection period and up 5.1% in the previous period

Second quarter Revenue Act collections grew 4.5% year over year Figure 3.2 shows seasonally adjusted Revenue Act receipts excluding payments received under the tax amnesty program in early 2011 and other large payments. It is also adjusted for some changes in payment patterns. As shown in the figure, collections have been on an upward trend since November 2009. Growth was aided by a temporary increase in the business and occupation tax rate paid by service industries that took effect in May 2010. This temporary increase expired on July 1, 2013. Adjusted for large one-time payments and refunds, receipts grew 7.7% year over year in the August 11 - September 10 collection period and 5.1% in the previous period.

Adjusted Revenue Act collections from May 11 – August 10, 2014, which primarily reflected second quarter 2014 taxable activity, were up 4.5% year over year. Revenue Act collections from first quarter activity (February 11 – May 10, 2014 adjusted collections) were up 2.5% year over year, while fourth quarter 2013 growth was up 4.8% year over year. Year-over-year growth rates were lowered by about 2 percentage points due to the expiration of the temporary business and occupation tax surcharge on July 1, 2013.

Figure 3.2: Revenue Act Collections\*

Source: ERFC; Data through September 10, 2014 preliminary allocation \*Adjusted for large payments/refunds and payment pattern change

Both large commercial sales and residential sales were higher than forecasted Much of the large positive variance in REET collections was due to strong sales of commercial property, but residential sales were also higher than forecasted in two of the three months since the forecast. While June sales of properties valued at \$10 million or higher totaled \$609 million, weaker residential sales caused seasonally adjusted activity to fall from May's commercial property-fueled spike (see Figure 3.3). July's \$629 million in large sales created another spike in the chart of taxable activity, similar to the spikes created by other large commercial property sales over the last two years. While August large sales fell to \$311 million, strong residential sales caused seasonally adjusted activity to remain elevated.

Figure 3.3: Taxable Real Estate Excise Activity, SA

Large commercial sales caused another spike in taxable real estate activity in July but residential strength in August kept activity elevated

Source: ERFC; data through August 2014

# **Revenue Forecasts by Source**

## **Department of Revenue**

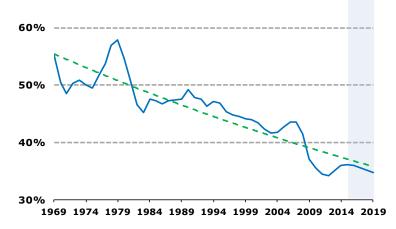

Taxes collected by DOR are most of GF-S taxes The Department of Revenue (DOR) collects and administers the majority of Washington's GF-S revenue, accounting for 95% of total GF-S revenue in the 2011-13 biennium. The largest tax sources administered by the DOR are the retail sales tax, business and occupation tax, property tax, use tax, cigarette tax and real estate excise tax. The revenue forecasts discussed below can be found in Tables 3.5-3.8.

Retail sales taxes are the largest source of GF-S revenue The retail sales tax is the largest source of GF-S revenue, accounting for 46.8% of GF-S revenue in FY 2014 (preliminary estimate). The state's share of the tax is 6.5% of the sales price. While construction labor, repair services, and some other

services are taxed, the tax does not apply to most services. Taxable sales as a share of personal income have been declining. Their share fell sharply during the recession and continued to fall through FY 2012. In that year, 34.2% of personal income was spent on taxable items, the lowest percentage on record. The taxable sales share of personal income grew to 35.1% in FY 2013 and is forecasted to increase to 35.9% in FY 2014, due largely to the elimination of the sales tax exemption for wired phone lines that took effect on July 1, 2013. The share is then forecasted to increase slightly to 36.1% in FY 2015 before declining through FY 2019. The historical and forecasted relationship between taxable sales and income is illustrated in Figure 3.4.

Figure 3.4: Taxable Sales\* as Percentage of State Personal Income

The ratio of taxable sales to state personal income is below a declining trend

 $\ensuremath{^{*}}\mbox{Past}$  tax base adjusted to represent current base. Shaded area indicates forecast

Source: ERFC; forecast through FY 2019

Retail sales tax receipt growth forecast:

FY15: 5.4% FY16: 5.1% FY17: 5.0% FY18: 4.6% FY19: 4.2% After declines of 10.4% in FY 2009 and 6.0% in FY 2010, taxable retail sales managed an increase of 1.8% in FY 2011 (see Table 3.4). Extra sales tax collections from the tax penalty amnesty program in the spring of 2011, however, brought the growth rate of actual collections up to 3.2% for the fiscal year. The growth rate of taxable activity improved from 4.1% in FY 2012 to 6.7% in FY 2013, due mainly to increasing construction activity. Continued growth in construction, along with the newly-revoked sales tax exemption on wired home phone lines, brought growth in taxable activity of 6.4% in FY 2014 (preliminary estimate). Growth is forecasted to slow to 5.1% in FY 2015 as the rate of construction activity growth slows, and continue slowing through the end of the forecast period, with 4.2% growth in FY 2019. Due to the lag between taxable activity and collections and the presence of tax deferrals, credits, refunds, and payments of past due taxes, the growth in actual collections differs from the growth in taxable activity. Growth in collections for FY 2014 was

7.0%. Forecasted FY 2015 growth is 5.4%. Growth is then forecasted to slow to 5.1% in FY 2016 and 5.0% in FY 2017. FY 2018 growth is forecasted at 4.6% and FY 2019 at 4.2%.

Business and Occupation taxes are the second largest source of GF-S revenue The business and occupation (B&O) tax is the second largest source of GF-S revenue, accounting for 19.8% of GF-S revenue in FY 2014. It is a tax on the gross receipts of all businesses operating in Washington. The state portion of the tax applies ten different rates according to various classifications of business activities. In FY 2014, the largest contributor to total state B&O tax was the services sector, which had a gross tax rate of 1.5% and represented an estimated 41% of B&O taxes due. The next largest sector was retailing, which is taxed at 0.471% and represented an estimated 23% of taxes due, followed by the wholesaling sector, which is taxed at 0.484% and represented an estimated 20% of taxes due.

B&O tax growth forecast:

FY15: 5.0% FY16: 5.1% FY17: 5.6% FY18: 5.1% FY19: 4.9% temporary increase in the B&O service tax rate on July 1, 2013, in addition to several large refunds, caused receipts to shrink by 1.8% in FY 2014. Growth is forecasted to rebound to 5.0% in FY 2015, 5.1% in 2016 and 5.6% in FY 2017. Growth in FY 2018 and 2019 is forecasted at 5.1% and 4.9%.

In FY 2013, B&O tax receipts grew by 5.8%. The expiration of a

State property taxes are the third largest source of GF-S revenue. Growth forecast:

FY15: 2.2% FY16: 2.3% FY17: 2.3% FY18:2.3% FY19: 2.5% The state property tax levy is the third largest source of GF-S revenue, accounting for 12.0% of total revenue in FY 2014. Though the tax goes into the GF-S, it is dedicated to the funding of basic education. By law, the total state tax levy on existing property can only increase by the lesser of 1% per year or the rate of inflation as measured by the year-over-year change in the U.S. Implicit Price Deflator in July of the year preceding the levy, unless a greater increase is approved by the voters. The year-to-year growth in the total amount levied, however, can exceed the aforementioned limits due to the value of new construction, property improvements, and other additions to real property assessed by the state. Collections can also grow faster or slower than the rate of assessment growth due to the payment of past due taxes or nonpayment of current taxes. Property tax receipts grew by 2.1% in FY 2014 and are forecasted to grow by 2.2% in FY 2015 and 2.4% in FY 2016. Growth in FY 2017 and 2018 is forecasted at 2.3%, with FY 2019 growth of 2.5%.

REET was the fourth largest GF-S source in FY 2014 The real estate excise tax (REET) was the fourth largest DOR source of GF-S revenue in FY 2014, accounting for 3.8% of total revenue. The state portion of REET is 1.28% of the sales price. The tax is divided between the GF-S (92.3%), a fund for local public works (2.0%), a fund for assistance of cities and counties (1.6%) and, as of July 1, 2013, the Education Legacy Trust Account (4.1%). The tax is applied to both residential and commercial real estate, including purchases of vacant land.

REET growth forecast:

FY15: -4.5% FY16: 3.2% FY17: 5.6% FY18: 2.3% FY19: 5.3% Due to a high number of large sales of commercial property, REET receipts grew by 34.0% in FY 2013. FY 2014 receipts were also boosted by large commercial sales, resulting in growth of 15.2%. Despite forecasted further strengthening in residential sales, FY 2015 receipts are forecasted to fall by 4.5% and only grow by 3.2% in FY 2016 due to a reduced level of commercial sales. Growth in FY 2017, 2018 and 2019 is forecasted at 5.6%, 2.3% and 5.3% respectively.

Use tax was the fifth largest GF-S source in FY 2014 The state use tax was the fifth largest GF-S revenue source in FY 2014 at 3.4% of total receipts. The state portion of the tax is 6.5% of the purchase price for items used in the state that were not subject to the state retail sales tax. Examples of items subject to the state use tax are goods purchased out-of-state; online and mail-order purchases, where sales tax was not collected; or purchases of used vehicles from private individuals.

Use tax growth forecast:

FY15: 2.7% FY16: 2.8% FY17: 5.0% FY18: 4.2% FY19: 4.1% Use tax receipts grew by 8.8% in FY 2013, boosted by strong sales of used vehicles and a temporary spike in payments from the manufacturing sector in the 4<sup>th</sup> quarter of 2013. The absence of the large payments from the manufacturing sector is forecasted to cause receipts to grow by only 2.7% in FY 2015. Forecasted lower growth in vehicle sales brings 2.8% growth in FY 2016. Growth then returns to a more normal pace in FY 2017, 2018 and 2019 with rates of 5.0%, 4.2% and 4.1% respectively.

Public utility taxes were the sixth largest GF-S source in FY 2014 Public utility taxes were the sixth largest DOR source of GF-S revenue in FY 2014, bringing in 2.4% of total receipts. The tax applies to the gross income of sales to consumers by public and privately owned utilities and is in lieu of the B&O tax. The largest source of public utility taxes is the 3.873% tax on the distribution and generation of electrical power, followed by the 3.852% tax on the distribution of natural gas.

Growth forecast:

FY16: 4.3% FY17: 5.7% FY18: 6.3% FY19: 5.3%

FY15: 2.3%

Public utility tax receipts grew by 4.5% in FY 2014. A slowdown in the rate of increases in natural gas prices is forecasted to lower growth to 2.3% in FY 2015. Larger increases in utility prices coupled with increased housing construction are forecasted to produce growth rates of 4.3% in FY 2016, 5.7% in FY 2017, 6.3% in FY 2018 and 5.3% in FY 2019.

The cigarette tax was the seventh largest GF-S source in FY 2014 The state tax on cigarettes was the seventh largest DOR GF-S revenue source in FY 2014 at 2.4% of total receipts. Prior to FY 2010, the tax made up a much smaller portion of GF-S revenue because much of the tax was dedicated to non-GF-S accounts. In FY 2010, all of the tax except the portion dedicated to the Education Legacy Trust account was redirected to the GF-S, and in FY 2011 all of the cigarette tax was redirected to the GF-S. The current tax rate, which took effect May 1, 2010, is \$3.025 per pack of 20 cigarettes.

Cigarette tax growth forecast:

FY16: -3.1% FY17: -3.4% FY18: -3.3%

FY15: -1.9%

FY19: -3.0%

The total number of taxed cigarettes has been on a downward trend due to a continuing decline in the number of smokers. Recently, the rate of decline has been increasing further due to increased consumption of e-cigarettes, which are not subject to the cigarette tax but are subject to retail sales taxes. FY 2014 receipts decreased by 3.6%. Receipts are forecasted to decline by 1.9% in FY 2015, 3.1% in FY 2016 and 3.4% in FY 2017. Collections in FY 2018 and 2019 are forecasted to decrease by

3.3% and 3.0%.

# **Forecasted Revenue from Cannabis-Related Sales**

Sales of cannabis products in state-licensed stores began in July 2014

Initiative 502, approved by voters in the November 2012 election, legalized the sale and use of recreational cannabis and cannabis products in Washington. The first legal sales of cannabis products in state-licensed stores occurred in July 2014. Under the initiative, a cannabis excise tax of 25% is levied at each stage of growing, processing, and selling cannabis products. These taxes, along with annual license fees, will be collected by the Liquor Control Board and placed into a dedicated fund from which revenue will be distributed quarterly after required allotments are satisfied.

GF-S forecast of total cannahisrelated revenue by biennium (millions):

13-15: \$6.9 15-17: \$60.1 17-19: \$119.0 Due to continuing delays in implementation of the initiative and moratoriums on sales in many locations, the June forecast assumed that no state-licensed sales would occur before FY 2016. While sales have now begun, sales volumes have been low due to supply shortages and a small number of licensed stores. Forecasted FY 2015 revenue from cannabis sales is therefore small. Distributions of cannabis excise taxes to the GF-S, which amount to 18.7% of the distributed funds, are forecasted to total only \$3.1 million in the 2013-15 biennium. GF-S distributions are forecasted at \$31.1 million in the 2015-17 biennium and \$63.0 million in the 2017-19 biennium. Details of the forecasted distributions from the account can be found in Table 3.18. In addition to this revenue, growers, processors and sellers will pay business and occupation (B&O) taxes and sellers will collect and remit retail sales taxes. These taxes, detailed in Table 3.19, are expected to total \$3.8 million in the 2013-15 biennium, \$28.9 million in the 2015-17 biennium and \$56.0 million in the 2017-19 biennium. The total forecasted GF-S impact of cannabisrelated sales is therefore \$6.9 million in the 2013-15 biennium, \$60.1 million in the 2015-17 biennium and \$119.0 million in the 2017-19 biennium.

#### **Department of Licensing**

Forecast change by biennium (millions):

The majority of GF-S revenue collected by the Department of Licensing is from firearm and event licenses, watercraft excise tax, and boat registration fees. The forecast of GF-S revenue for

Chapter 3 57 the 2013-15 biennium has been increased \$0.6 million to \$35.3 million and the forecast for the 2015-17 biennium has been increased \$1.0 million to \$35.3 million. The department's forecast of revenue for the 2017-19 biennium has been increased \$1.5 million to \$36.0 million.

# The Office of Financial Management (Other Agencies)

Forecast change by biennium (millions):

13-15: \$12.0 15-17: \$5.4 17-19:\$5.4 The Office of Financial Management (OFM) is responsible for preparing General Fund-State revenue and transfer forecasts for all agencies excluding the Department of Revenue, the Department of Licensing, the Liquor Control Board, the Insurance Commissioner, the Washington State Lottery, and the State Treasurer. The office's forecast of revenue for the 2013-15 biennium was increased \$12.0 million to \$199.3 million due to an increased forecast of permit and fee revenue from the Department of Financial Institutions, increased transfers of revenue to the GF-S from the Commute Trip Reduction program and final transfers of residual balances from closed funds. The office's forecast for the 2015-17 biennium was increased \$5.4 million to \$165.8 million and the forecast for the 2017-19 biennium was increased \$5.4 million to \$174.7 million. Most of the forecast increases in the 2015-17 and 2017-19 biennia were due to increases in the forecasts of revenue from the Department of Financial Institutions.

#### **State Treasurer**

Forecast change by biennium (millions):

13-15: \$1.4 15-17: -\$4.5 17-19: -\$14.6 The Office of the State Treasurer generates GF-S revenue by investing state short-term cash reserves. The office's forecast for the 2013-15 biennium has been increased \$1.4 million to negative \$3.8 million. The forecasted revenue is negative because the average daily balance of accounts that earn interest that goes into the GF-S is forecasted to be negative. When this occurs, the GF-S effectively pays interest to the other funds managed by the office. The forecast for the 2015-17 biennium has been decreased \$4.5 million to \$7.6 million and the forecast of revenue for the 2017-19 biennium has been decreased \$14.6 million to \$30.6 million. Forecast decreases in the 2015-17 and 2017-19 biennia were due to updates of forecasted distributions of interest earnings to local governments.

## **Insurance Commissioner**

Forecast change by biennium (millions):...

The Office of the Insurance Commissioner collects premium taxes on most classes of insurance sold in Washington State. These taxes are distributed to the GF-S and various accounts in support of fire services. The office's forecast of GF-S revenue for the 2013-15 biennium has been increased \$0.3 million to \$943.7

13-15: \$0.3 15-17: -\$24.8 17-19: -\$42.3 million. The forecast for the 2015-17 biennium has been decreased \$24.8 million to \$1,016.6 million and the forecast of revenue for the 2017-19 biennium has been decreased \$42.3 million to \$1,085.6 million. The forecast decreases were due to changes in the forecast of the amount of health insurance tax revenue that would be transferred to the Health Benefit Exchange.

# **Liquor Control Board**

Forecast change by biennium (millions):

13-15: \$6.2 15-17: \$7.6 17-19: -\$0.2 The Liquor Control Board (LCB) collects fees from distributors and retailers on sales of spirits and surtaxes on sales of beer and wine (sales and liter taxes on sprits are collected by the DOR). The LCB is also responsible for the collection of excise taxes and fees associated with the legalized sale and use of recreational cannabis. The forecast of total GF-S revenue collected by the LCB for the 2013-15 biennium has been increased \$6.2 million to \$256.1 million. The forecast of LCB GF-S revenue for the 2015-17 biennium has been increased \$7.6 million to \$242.4 million and the forecast of revenue for the 2017-19 biennium has been decreased \$0.2 million to \$293.4 million. Most of the forecast changes were due to changes in forecasted cannabis excise tax receipts, which are transferred to the GF-S through the LCB.

# **Lottery Commission**

The Lottery Commission now transfers funds to the GF-S only when the revenue from certain games exceeds a \$102 million threshold The disposition of proceeds from the state lottery was substantially changed by E2SSB 6409 in the 2010 legislative session. Prior to the passage of the bill, the Lottery Commission transferred the bulk of its net proceeds to the School Construction Account, and any proceeds remaining after that account and several smaller accounts received their allotments was transferred to the GF-S. Under the 2010 legislation, existing obligations to the Stadium/Exhibition Center, Problem Gambling and Economic Development accounts were maintained, but the remaining revenue, which represents the bulk of the proceeds, are transferred almost entirely to the Washington Opportunity Pathways Account (OPA). The exception is that when total profits from all Washington-only games plus the Powerball game exceed \$102 million per year, the amount above \$102 million gets transferred to the GF-S. In FY 2013, large Powerball jackpots pushed sales above the threshold, resulting in a \$9.3 million payment to the GF-S in FY 2014. Profits just exceeded the threshold again in FY 2014, resulting in a total GF-S transfer of \$9.9 million for the 2013-15 biennium. GF-S transfers totaling \$2.3 million are forecasted for the 2015-17 biennium and \$2.7 million for the 2017-19 biennium.

Washington Opportunities Pathways Account forecast change by biennium (millions):

13-15: \$5.4 15-17: -\$2.8 17-19: -\$0.3 The OPA receives all profits (excluding statutory transfers) from Washington-only lottery games plus all profits from the Mega Millions game. The forecast of transfers for the 2013-15 biennium has been increased \$5.4 million to \$232.6 million, and the forecast for the 2015-17 biennium has been decreased \$2.8 million to \$235.2 million. The forecast for the 2017-19 biennium has been decreased \$0.3 million to \$237.8 million. In addition to the transfers described above, legislation from the 2013 second special session and 2014 regular session also require the transfer of \$16.1 million in Lottery proceeds to the Education Legacy Trust Account in the 2013-15 biennium. Details of the forecast of the distribution of Lottery earnings can be found in Table 3.15 on a cash basis and Table 3.16 on a GAAP basis.

## **Administrative Office of the Courts**

Forecast change by biennium (millions):

13-15: -\$2.2 15-17: -\$7.6 17-19: -\$7.0 The Administrative Office of the Courts collects surcharges on certain filing fees, fines, and infraction penalties and transfers this revenue to the GF-S on a monthly basis. The forecast of transfers to the GF-S for the 2013-15 biennium has been decreased \$2.2 million to \$170.0 million. The forecast for the 2015-17 biennium has been decreased \$7.6 million to \$174.4 million and the forecast of transfers for the 2017-19 biennium has been decreased \$7.0 million to \$186.4 million.

#### Track Record for the 2013-15 Biennium

The September 2014 forecast is \$904 million (2.8%) higher than the initial February 2012 forecast

Table 3.10 summarizes the historical changes to the GF-S revenue forecast for the 2013-15 biennium. The February 2012 forecast was the initial forecast for the biennium. The September 2014 forecast for the biennium is \$904 million (2.8%) higher than the initial forecast. Non-economic changes have increased the forecast by \$369 million (1.1%). Excluding non-economic changes, the current forecast is \$535 million (1.6%) higher than the initial forecast. The current forecast is \$547 million (1.7%) higher than the sum of the June 2013 forecast and the \$123 million in legislated revenue increases from the June 2013 second special session that were the basis of the initial budget for the 2013-15 biennium.

#### Track Record for the 2015-17 Biennium

The September forecast is \$560 million (1.6%) higher than the initial September 2012 forecast

Table 3.11 summarizes the historical changes to the GF-S revenue forecast for the 2015-17 biennium. The September 2012 forecast was the initial forecast for the biennium. The September 2014 forecast for the biennium is \$560 million (1.6%) higher than the initial forecast. Non-economic changes have increased the forecast by \$257 million (0.7%). Excluding

non-economic changes, the current forecast is \$303 million (0.9%) higher than the initial forecast.

## The Relationship between the Cash and GAAP General Fund-State Revenue Forecasts

GAAP forecasts are based on the period in which the revenue is earned rather than received Legislation enacted in 1987 requires that the state's biennial budget be in conformance with Generally Accepted Accounting Principles (GAAP). It also requires a GF-S revenue forecast on both a cash and GAAP basis. The GAAP forecasts of GF-S revenue for the 2011-13 and 2013-15 biennia are presented in Tables 3.6 and 3.8 and the GAAP forecast of Lottery revenue transfers for both biennia is in Table 3.15. The primary difference between the cash and GAAP forecasts is the timing of the receipt of revenue. On a GAAP basis, revenue is credited to the biennium in which it is earned even though it may not have been received. The cash forecast, on the other hand, reflects expected cash receipts during a fiscal period. The forecast on a GAAP, or accrual, basis is primarily used for financial reporting. The cash forecast is used for cash flow management and revenue tracking. The cash forecast is also the forecast used in the state's budgetary balance sheet, which is the principal tool for assessing the General Fund's current surplus or deficit position. References to the GF-S forecast in the text of this chapter refer to the cash forecast unless otherwise noted. Likewise, figures from revenue tables other than Tables 3.6, 3.8 and 3.16 are projected on a cash basis.

# **Budgetary Balance Sheet for the 2013-15 Biennium**

The forecast implies GF-S reserves of \$1.19 billion at the end of the 2013-15 biennium and \$1.17 billion in reserves for GF-S, ELTA and OPA

Table 3.12 shows the budgetary balance sheet for the 2013-15 biennium as prepared by the Office of Financial Management and the House and Senate fiscal committees. The balance sheet shows not only projected GF-S spending and resources but also total projected spending and resources for the GF-S plus the other main non-transportation state-funded accounts: the Education Legacy Trust Account (ELTA) and the Washington Opportunity Pathways Account (OPA). As shown in the table, there was a beginning fund balance of \$167.5 million for the GF-S at the end of the 2011-13 biennium and the total balance for GF-S, ELTA and OPA stood at \$156.4 million. Based on the September 2014 revenue forecast and currently enacted budgets, total GF-S reserves are projected to be \$1,191.0 million at the end of the 2013-15 biennium. The projected total GF-S reserves are comprised of a GF-S ending balance of \$607.0 million and a balance of \$584.0 million in the Budget Stabilization Account. Projected combined reserves for the ELTA and OPA are -\$23.5 million, for total projected reserves of \$1,167.5 million for GF-S, ELTA and OPA at the end of the 2013-15 biennium.

#### Alternative Forecasts for the 2013-15 and 2015-17 Biennia

Optimistic scenarios (billions):

13-15: +\$0.9 15-17: +\$3.4

Pessimistic scenario:

13-15: -\$1.0 15-17: -\$3.5 Chapter 2 outlines optimistic and pessimistic economic scenarios relative to the baseline economic forecast. The forecast assigns a probability of 55% to the baseline forecast, 20% to a scenario based on the upside risks and 25% to a scenario based on the downside risks. The revenue implications of these alternative scenarios for the 2013-15 biennium are shown in Table 3.13 and those of the 2015-17 biennium are shown in Table 3.14. For the 2013-15 biennium, the optimistic forecast generates \$34,260.1 million in GF-S revenue, \$928.2 million (2.8%) more than the baseline scenario, while the pessimistic forecast produces \$32,301.5 million in revenue, \$1,030.4 million (3.1%) less than the baseline. For the 2015-17 biennium, the optimistic forecast generates \$39,468.9 million in GF-S revenue, \$3,390.8 million (9.4%) more than the baseline scenario, while the pessimistic forecast produces \$32,599.9 million in revenue, \$3,478.3 million (9.6%) less than the baseline.

### Near General Fund Forecasts for the 2013-15 - 2017-19 Biennia

Near General Fund Forecast (millions):

2013-15: \$33,719.1

2015-17: \$36,474.2

2017-19: \$39.614.0 "Near General Fund" accounts are those included in the GF-S plus the Education Legacy Trust Account. The Education Legacy Trust Account was previously funded by a portion of the state tax on cigarettes and a tax on estates of over \$2 million. Legislation from the 2011 session, however, requires the cigarette taxes that formerly went into the account to instead be deposited into the GF-S. The Near General Fund forecast for the 2013-15 biennium is \$33,719.1 million, \$163.1 million more than the June forecast, and the forecast for the 2015-17 biennium is \$36,474.2 million, \$141.6 million more than the June forecast. The forecast of Near General Fund revenue for the 2017-19 biennium is \$39,614.0 million, \$208.8 million more than the June forecast. The Near General Fund forecast and recent history by fiscal year are presented in Table 3.17.

<sup>\*</sup> Actual Base. Includes statutory and administrative changes to the tax base. Historical fiscal year data are from quarterly taxable sales reported by taxpayers on the state's Combined Excise tax return. Reported totals affected by enacted legislation. Major base changes include: exemption of off-premises food, beginning 1978:3 (fiscal 1979); extension of the sales tax base to off premises food (1982:2 to 1983:2); food again exempt 1983:3 (fiscal 1984); extension of the sales tax base to candy, gum and bottled water (June 1 - December 2, 2010); elimination of sales tax exemption for residential phone service (July 1, 2013).

## Chapter 4: Washington Boom Monitor Index

- The Boom Monitor Index (BMI) is a coincident index based on Data Resources, Inc.'s national Boom Monitor. The index measures the sustainability of Washington growth while also providing insight to upside and downside risks.
- A boom is a period of unsustainable growth in the economy, advancing at a rate that far exceeds historical and balanced growth rates.
- Rapid expansions in major sectors such as the housing market or technology fields can cause a boom to occur.
- A boom reading is classified as any reading above 70, with the index historically averaging 50. Readings above 70 indicate unsustainable growth.
- This latest revision comprises several component changes and a reweighting of the index, improving current and historical accuracy.

## The Original Data Resources, Inc. Boom Monitor

The Boom Monitor Index measures the sustainability of growth The original Boom Monitor Index (BMI) was designed and constructed by Data Resources, Inc, an economic data firm who later merged with Wharton Econometric Forecasting Associates to form Global Insight, now IHS Global, Inc. At its inception the original BMI measured the sustainability of growth rates in the national economy. There were a total of eight components in this index, each of which measured a specific sector in the economy that was historically shown to have cyclical behavior that contributed to economic booms and busts. The eight chosen components were (1) the change in the ratio of consumer credit outstanding to disposable income, (2) the ratio of car sales to the driving age of the population, (3) the ratio of housing starts to the population age 20 and older, (4) the DRI Index of Labor Market Tightness, (5) the eighteen-month growth in the real monetary base, (6) the Federal Reserve Board capacity utilization rate for materials industries, (7) the ratio of capital spending to real trend-line Gross National Product, and (8) vendor performance. In addition to their contribution to economic booms, these series were chosen because their readings are both timely and reliable from month to month. Data Resources, Inc. discontinued the Boom Monitor Index in April 1985.

Each component series is detrended and weighted To construct the composite index, each of the eight series is first regressed against time in order to correct for any historical upward or downward trends. Then, the series are adjusted so they have an average value of 50 and a standard deviation of 20. These indexed values are then weighted according to their standard errors in regressions against the U.S. Department of Commerce's Index of Coincident Indicators. The sum of these weighted component series comprises the Boom Monitor Composite Index.

Readings above 70 indicate unsustainable growth The BMI Composite has a historical average of 50 and a standard deviation of 20, just like the component series. Any reading more than one standard deviation away from the average (above 70) indicates growth rates that are only temporarily sustainable. During the 1960s and 70s boom periods, the BMI averaged a level of 66.1, a reading near the threshold of unsustainable growth.

## **The Original Washington Boom Monitor**

Some data sets are not available at the state level While timely, reliable data often exists on a national level, the same information is either inapplicable at the state level, not collected with appropriate frequency, or simply does not exist. Thus, candidate component series for the Washington Boom Monitor are much more limited. Series such as capital spending, capacity utilization and consumer credit do not exist at the state level or are limited in their historical ranges. Other measures, such as vendor performance, are not published on a monthly basis and were not applicable for this index.

Washington BMI is composed of six component series The six chosen component series for the Washington BMI were (1) aerospace employment, (2) the unemployment rate in Washington, (3) housing units authorized by building permits, (4) new car and truck registrations in Washington, (5) real estate excise tax collections, and (6) the dollar amount of repossessions and delinquent loans outstanding at Federal Home Loan Bank member institutions in Washington. The Washington BMI is constructed in the same fashion as DRI's national BMI. Each component series is first seasonally adjusted and then detrended by regressing the series against a time trend. The detrended components are then adjusted to have a long run mean of 50 and standard deviation of 20. These adjusted components are then weighted by their standard errors in regressions against total employment and revenues. The sum of the weighted component series comprises the Washington Boom Monitor Composite Index.

BMI available from December 1970 forward Due to their volatility, several components of this index, such as new car and truck registrations and housing unit authorizations, were smoothed. In addition, a majority of these components only date back to 1968-1970, whereas DRI's national data was available back to the late 1940s. Due to these limitations and the method of constructing the Boom Monitor Index, Washington's BMI is available only as far back as December 1970.

## Washington's Boom Monitor Index - 1999 Revision

First revision was in 1999

After its inception in the June 1990 publication, the Washington Boom Monitor Index underwent its first revision in March 1999. These revisions included (1) updating the detrending regressions, (2) updating the regression of index components against employment, and (3) correcting and updating historical data for several of the series.

Revisions included reweighting and updates to component series The component variables had not been reweighted for some time and were out of date, given the influx of new data since their initial weighting. Initially, weighting regressions were run through 1990, but the new data allowed for updated regressions to be run through November 1998. Aerospace employment received the largest modification to its weight during this revision. Originally the series was weighted at just under sixteen percent, but was updated with the revised weighting for an overall weight of twenty-three percent, the largest of all component series.

New vehicle registrations were separated into car and truck registrations Additionally, the weights for real estate excise tax and new vehicle registrations were both adjusted accordingly using the revised reweighting procedure. In particular, new vehicle registrations were broken down into two components: new car registrations and new truck registrations. This change was made in order to correct for a 1973 change in data source for this series and to better isolate the effects of car and truck sales on the composite index. The Seattle Times help wanted/ unemployment rate index was also added during this time.

Weighting now based on payroll data Finally, a major change to the weighting procedure was made during this first revision. In the original model, all component variables were weighted against total employment and revenues. However, total employment is based on sample data and is likely less representative of actual employment than payroll data. Since nonfarm employment is based on actual payroll data, future series and the 1999 revision were weighted using Washington nonfarm employment.

## Washington's Boom Monitor Index - 2014 Revision

Old index was volatile from month to month After the 1999 revision, Washington's Boom Monitor Index was not revised until September 2014, except for annual reweighting. The BMI underwent a large number of changes with the goal of smoothing out the volatile month-to-month readings of the old index, updating components to take into account the most recent housing bubble and subsequent collapse, and to reweight the index for a more accurate picture of the sustainability of Washington's economic growth.

Components were changed to more accurately reflect recent history First, many of the BMI's components were updated for new data or changed completely to more accurately reflect recent economic events. Components that remain unchanged are (1) unemployment rate, (2) aerospace employment, and (3) real estate excise tax. It should be noted that real estate excise taxes are divided by an implicit price deflator in order to adjust for inflation. The log base-10 of these values

is then taken to compensate for their historical exponential upward trend and to allow for linear detrending.

Other components were either eliminated or modified While the aforementioned variables were simply updated for new data, the other components were either eliminated or modified to present a more accurate picture of the Washington state economy, including (1) construction employment, (2) help wanted/labor force index, (3) Seattle-area house price index, (4) new vehicle registrations, and (5) taxable retail sales (minus automotive and construction).

A house price index and construction employment are used instead of housing authorizations

Previously, housing authorizations were used to measure the housing market. However, authorizations are a leading indicator, where as the BMI Composite is a coincident indicator. Additionally, authorizations are one of the more volatile measures of housing activity, which contradicts one of the goals of this revision. In its stead, construction employment and a Seattle-area house price index are used. Construction employment is viewed as an actual measure of current housing activity, while the house price index is a much less volatile measure of the housing market and captures the full effect of housing value changes on economic growth. Large changes in housing prices have typically been associated with economic booms and recessions. Skyrocketing house prices played a large part in creating unsustainable growth both in Washington State and across the nation prior to the most recent 2007-09 recession.

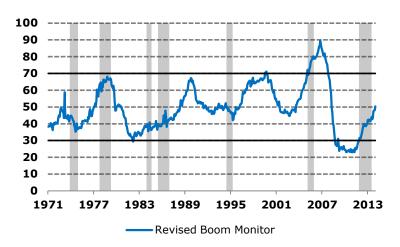

Help wanted divided by labor force instead of unemployment The help wanted/labor force index was previously a help wanted/unemployment rate index. However, dividing help wanted by a labor force index captures all of the labor force, not just those who are unemployed. Also, all individuals in the labor force can respond to a help wanted ad, not just the unemployed, and an increased willingness to leave one's job for a new position is indicative of a strong labor market.

Taxable retail sales (minus automotive and construction) are added Previously separated passenger car and truck sales have once again been combined back into new vehicle registrations as the old index might have placed too much emphasis on the automotive industry in its measurements. In an attempt to avoid double-weighting an indicator, taxable retail sales, a measure of consumer spending, does not include automotive purchases or purchases from the construction sector.

Technical notes

The most recent revision to the Washington Boom Monitor Index follows a similar methodology to that previously used. After undergoing seasonal adjustment, the component series are regressed against time and time-squared, as well as solely time and solely time-squared. The appropriate detrending regression is determined using adjusted  $R^2$  and then confirmed using the Schwarz criterion and adjusted  $R^2$ . Detrended variables are then adjusted to have an average of 50 and a standard deviation of 20. These variables are then weighted based on their standard errors in a regression against Washington nonfarm employment. The summation of the weighted values is the Boom Monitor Index.

## The Washington Boom Monitor and the Washington Index of Leading Indicators

BMI accurately follows WILI Although there is an upward trend to the Washington Index of Leading Indicators (WILI) and the Boom Monitor Index is detrended, there is a clear correlation between the two indicators (see Figure 4.2). Peaks and troughs for the BMI correspond with the WILI directly and their slopes are very similar for periods of rise and fall.

Figure 4.2: Washington Boom Monitor and Washington Index of Leading Indicators

Both BMI and WILI on upward trends recently

## The Washington Boom Monitor and Employment

Comparing BMI to employment... The methodology used to create the Washington Nonfarm Employment Index is the same methodology used to create each of the component

... serves as a check for readings series in the BMI. Although the Employment Index is not a component series in and of itself, it plays an integral part in weighting each component as part of the composite BMI. Comparing the Employment Index and the BMI can also serve as a check and balance to confirm the movements of the BMI. However, current slack in the labor market is causing the Employment Index to move in the opposite direction of the BMI. Yet, historically, opposite movements of the indices have a precedent in post-recession periods until the labor market recovers, as seen in Figure 4.3.

Figure 4.3: Revised Washington Boom Monitor and WA Nonfarm Employment

Slack in the labor market causes a lag after recessions

## The Washington Boom Monitor and Components

Correlation between measures

Figures 4.5 through 4.7 illustrate the relationship between the revised Boom Monitor Index and the Unemployment Rate Index, Aerospace Employment Index, and the Construction Employment Index. Although the Unemployment Rate Index is slightly more volatile from peak to trough than the Boom Monitor, there is a strong and obvious correlation between the two measures.

There is a lag between BMI and aerospace employment The same correlation is also found in Figure 4.6 when comparing the Boom Monitor to Aerospace Employment. There is a lag between the two indices, most notably in the 1970s-80s and from the late 1990s to mid 2000s, but the same cyclical pattern is immediately apparent to the casual observer.

Compared to the Construction Employment Index Illustrated in Figure 4.7 is the relationship between the Revised Boom Monitor and the Construction Employment Index. This series shows a remarkable propensity towards following the BMI, even obtaining similar magnitudes throughout its history, with the exception of the housing-fueled bubble and subsequent collapse in the late 2000's, where construction employment reached a higher peak and a lower depth than the composite reading.

There is a clear correlation between the composite and help wanted/labor force index

Figures 4.8 through 4.10 depict the relationship between the composite BMI and the Seattle Times Help Wanted index divided by labor force, New Vehicle Registrations, and Real Estate Excise Tax collections, adjusted for inflation. There is a clear correlation between the BMI and the help wanted/labor force index. While the latter has a much larger amplitude than the composite reading, the same cyclical pattern is inherently obvious.

Compared to New Vehicle Registrations Index Figure 4.9 exhibits the correlation between the revised BMI and the New Vehicle Registrations Index. While it is historically an extremely volatile month-to-month indicator, the index follows the revised Boom Monitor's trends quite well if one looks past the white noise and at the overall trend.

Compared to Real Real Estate Excise Tax The inflation-adjusted Real Estate Excise Tax (RREET) Index has a clear connection with the composite Boom Monitor, as illustrated in figure 4.10. While it is another inherently noisy measure due to fluctuations in the housing market, the RREET Index follows the larger cyclical pattern of the BMI quite well. Its correlation is especially clear during the most recent recession as collections plummeted due to the housing market collapse.

Compared to housing indices

Figures 4.11 and 4.12 depict the Boom Monitor alongside a Seattle House Price Index and Taxable Retail Sales, respectively. While there is a small lag between house prices and the Boom Monitor, the correlation between the two measures is inherently clear.

BMI and taxable retail sales follow each other closely There is also an obvious relationship between the revised Boom Monitor and the Taxable Retail Sales Index. Taxable Retail Sales, as an approximate measure of consumer spending, follows the overall trend of the composite Boom Monitor fairly well, with periods of rise and fall having similar slopes. Taxable Retail Sales are of a slightly lower magnitude than the composite index coming out of the most recent recession, but prerecession sales were artificially inflated due to high housing prices and unsustainable levels of consumer spending. It should be noted that in 1977 the state sales tax on food products was eliminated, only to be temporarily reintroduced in 1982 in response to economic recession, leading to dramatic fluctuations in taxes collected during these periods.

## **Index Limitations**

The index does not come without its drawbacks due to data availability While the Boom Monitor is an important tool, it does not come without its drawbacks. First and most importantly is the limited availability of appropriate data. Some component series which may be theoretically appropriate for use on the state level may not exist or may not be reliable enough for accurate use. Second, some series have inherent flaws due to changes over time in data collection or reporting methodologies, but need to be used because the most appropriate data set may not exist on a state level. As additional data sources are identified, future revisions may take into account this additional information.

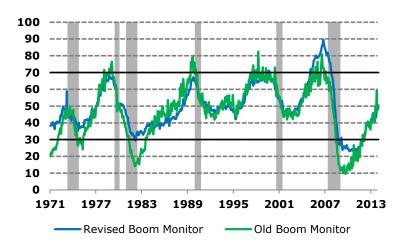

## **Recent Activity**

Washington back on upward trend For the past twelve months, the Boom Monitor has averaged 44.6, a moderate distance from the historical average of 50, but well above the low 20's readings experienced during the immediate aftermath of the recession. The index has a current upward trend as Washington's economy continues to recover and approach sustainable growth levels. Year-over-year, the index is up 19.1 percent with its most recent reading coming in at 50.4.

## The Washington Boom Monitor as an Economic Indicator

Revised index is smoother and more representative of recent events With the updated weights, new data, and revised components, the Boom Monitor reveals a slightly narrower range than the previous iteration, with a range of 23.0 to 89.7, as opposed to 9.6 to 82.5. The revised index is much smoother than the old index, with much less month to month volatility. Additionally the revisions now allow the index to fully capture the effect of the housing market on Washington's economy, an important trait, taking into account the recent housing bubble.

Figure 4.4: Revised and Old Washington Boom Monitor

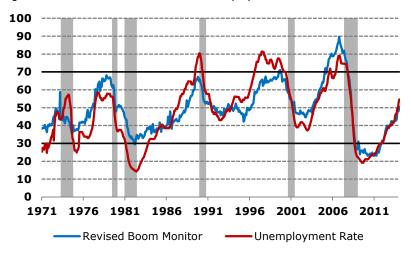

Source: ERFC, data through August 2014

Also offers insight into upside and downside risk adjustments Despite the caveats mentioned above, the Boom Monitor Index is an important economic indicator. It indicates whether current growth levels are sustainable or simply part of a temporary boom. While high growth levels bode favorably for consumer confidence, they can falsely lead to extended periods of optimism that are not sustainable in the long run. The Boom Monitor gives forecasters a glimpse into growth rate sustainability and provides useful information for making upside and downside risk probability adjustments.

Appendix

### Glossary

**Biennium:** The state's two years budget cycle.

**CPI:** The Consumer Price Index for All Urban Consumers. The Bureau of Labor Statistics (BLS) updates the CPI monthly, surveying over 60,000 goods in 85 urban areas.

**Tax Elasticity:** A measure of how tax revenues respond to changes in personal income. If tax revenue elasticity is greater than one, a one percent change in personal income will be associated with more than a one percent increase in tax revenues. If elasticity is less than one, a one percent increase in personal income will be associated with less than a one percent increase in tax revenues.

**Fiscal Year**: The state's budget year. Washington State's fiscal year runs from July 1 through June 30. Fiscal year 2014, for example, ran from July 1, 2013 through June 30, 2014.

**GAAP Basis:** Generally Accepted Accounting Principles measure revenue in the period during which they accrue rather than the period in which they are received.

General Fund: Accounts for all financial resources and transactions not accounted for in another fund.

**General Fund-State (GF-S) Revenue:** Resources from state sources only, excludes federal monies. The general fund is the principal state fund supporting the operation of the state.

**Implicit Price Deflator, PCE (IPD):** The IPD for consumption is a by-product of the National Income and Product Accounts. It is derived by dividing current dollar (nominal) consumer expenditures by constant dollar (real) consumer expenditures.

**Mortgage Rate:** The average interest rate on 30 year conventional loan (as reported by Freddie Mac).

**Near General Fund:** All accounts included in the General Fund - State plus the Education Legacy Trust Account.

**Non-Wage Income:** Personal income other than from wages and salaries. The major components are: proprietor's income, transfer payments, and dividends, interest and rent.

**Real GDP:** Gross Domestic Production adjusted for the price level.

**Revenue Act:** Revenue Act taxes consist of the retail sales tax, use tax, business and occupation tax, public utility tax and tobacco products tax, plus penalty and interest payments associated with those taxes.

**Personal Income:** Income from wages and salaries; other labor income; proprietor's income; dividends, interest and rent; transfer payments; and a residence adjustment. It is reduced by employee contributions for social insurance.

**Seasonally Adjusted:** Adjusted for normal seasonal variations. Monthly statistics, such as the unemployment rate, are seasonally adjusted to make month-to-month comparisons possible.

**Seasonally Adjusted Annual Rate:** A rate for a given period that is typically less than one year, but that is computed as if the rate were for a full year and seasonally adjusted.

**Nonfarm Payroll Employment:** Civilian non-farm payroll employees. The self-employed, farm workers, members of the armed forces, private household employees, and workers on strike are excluded.
